## **Building Information Modelling Bim Software:**

Implementing Successful Building Information Modeling Erika Epstein, 2012 Building Information Modeling BIM is the process of generating and managing building data during a building's lifecycle. Today more and more architectural firms have adopted BIM software and processes because it allows them to produce measurably more work of better quality in shorter periods of time. Featuring case studies of firms of all sizes, this practical resource shows professionals how to implement BIM in the building industry around the globe. The book explains how BIM allows the data collected to plan, design, and build projects to continue to be used and added to during the occupied life of the building. Readers also become knowledgeable about the changing role of architects within the building industry as they embed BIM in their workflow. From interoperability and open standards, knowledge sharing and gathering data to the BIM software suite implementation, planning, and project workflow, this authoritative volume provides a thorough understanding of key aspects of BIM that practitioners need to understand.

*Building Information Modelling (BIM) in Design, Construction and Operations II* A. Galiano-Garrigos, L. Mahdjoubi, C.A. Brebbia, 2017-08-09 The papers presented at Building Information Modelling 2017 BIM are from a range of forums including plenary papers, workshops, seminars, and panel sessions. The conference was attended by experts from industry practice and academia sharing their work on key topics: the development of innovative solutions and the identification of future trends. The volume gives details of how BIM tools and techniques have fundamentally altered the manner in which modern construction teams operate, the processes through which designs are evolved, and the relationships between conceptual, detail, construction, and life cycle stages. BIM is essentially value-creating collaboration throughout the entire life cycle of an asset, underpinned by the statistics attached to them, and has far-reaching consequences on both building procurement and infrastructure. BIM 2017 papers cover topics such as BIM in design coordination, Construction operations, Building operation and maintenance, BIM and sustainability, Collaborative working and practices, Facilities management, integration and GIS integration, Automation in construction, Health and safety, BIM and interoperability, Life cycle project management, Cultural heritage, BIM and Robotics, Risk analysis and management, and Emergency analysis, planning, and management.

A Simplified Software Architecture for Self-updating Building Information Models (BIM) Pierre Henri Fuller, Massachusetts Institute of Technology. Department of Civil and Environmental Engineering, 2009

Building Information Modeling BIM is an emerging software technology that is revolutionizing the architecture engineering and construction A E C industry BIM technology employs object based 3D models containing the physical and functional characteristics of a facility that serve as a repository for lifecycle information in an open interoperable format

- 1 The major difference between BIM and Computer Aided Design Drafting CADD is that the former includes geometry and a plethora of building information while the latter includes only geometry
- 2 BIM utilization in the AEC industry has increased due to
- 3 BIM tools increasing productivity in design tasks
- 4 the increasing number of private and government agencies that have instituted BIM requirements
- 5 the pervasive use of computer analysis and simulations models
- 6 the benefits of BIM as lifecycle management tool

Current literature shows trends of a transition from a passive static model based approach to an active dynamic model based approach The active approach requires the integration of BIM with sensors to create self updating building models Previous research introduces the concept of a self updating building model

- 2
- 3
- 4
- 1

These systems involve complex software architecture and may perpetuate the problem of software interoperability This thesis explores the following question May a similar system be created to synthesize dynamic sensor data while improving upon previous research and simplifying the software architecture The author describes a prototype system called LiveBuild which integrates commercial BIM software with other off the shelf software components to create a self updating building model LiveBuild is the first self updating building model that operates as an extension to existing commercial BIM software Therefore the transition from static to active building models is as simple as installing a plug in LiveBuild may serve as the basis for future research in self updating building by providing simplified system that is well integrated with state of the art commercial design software Likewise the prototype is applicable for professional practice by allowing firms to use their existing BIM software to perform pilot projects with self updating technology The current prototype supports an interface with single commercial BIM software Autodesk Revit 2009 product however future prototypes may extend both the functions and interfaces for other BIM software
