

GEOPHYSICAL METHODS OF EXPLORATION

CORE DRILLING

Core drilling can be considered both a geological and geophysical technique and can be used to determine the true vertical orientation of a horizon. The information and accuracy of the results are the foundation of seismic. Core drilling also provides the location of structural trap potential. Core drills are used frequently to measure aquifer thickness where the seismic may be skewed (caused by ground movement) due to depth. The two locations are connected and measured by continuous and intermittent recording of continuous geophysical logging (acoustic and magnetic) vertical profile. Logging measurements are the most significant and costly methods employed throughout exploration since they are usually every decade.

SEISMIC

Seismic behaviour does normally not exhibit linear elastic behaviour, but generally is very elastic, up until the point of "yielding". The non-linear behaviour is usually not of concern, but is a concern in the case of strongly fractured and fluid-saturated rocks. However, after a certain strain, rocks are damaged, crushed and brittle failure has occurred. "Cement" cracks and the use of "curing" (water) fluids is the way to reduce this, but the solution is not always viable. Another problem is the reduced lateral and vertical resolution of seismic waves, which is due to the nature of seismic wave propagation. The solution is to use low velocity "shear" waves, which are more directional, but are not as good.

MAGNETIC TECHNIQUES

The magnetic control of most hydrocarbon systems, based on the use of magnetic minerals, is not as good as the control of seismic. Magnetic anomalies are usually not as good as seismic anomalies, and are not as good as seismic anomalies. However, magnetic anomalies are useful in the case of structural traps, and are useful in the case of structural traps. However, magnetic anomalies are not as good as seismic anomalies, and are not as good as seismic anomalies. However, magnetic anomalies are useful in the case of structural traps, and are useful in the case of structural traps.

ELECTRICAL TECHNIQUES

Several methods of electrical techniques are used in the case of structural traps, and are useful in the case of structural traps. However, electrical techniques are not as good as seismic anomalies, and are not as good as seismic anomalies. However, electrical techniques are useful in the case of structural traps, and are useful in the case of structural traps.

REMOTE SENSING

Remote sensing, whether satellite or aerial, is used in the case of structural traps, and is useful in the case of structural traps. However, remote sensing is not as good as seismic anomalies, and is not as good as seismic anomalies. However, remote sensing is useful in the case of structural traps, and is useful in the case of structural traps.

CONCLUSIONS
 Seismic methods are the most important in the case of structural traps, and are useful in the case of structural traps. However, seismic methods are not as good as seismic anomalies, and are not as good as seismic anomalies. However, seismic methods are useful in the case of structural traps, and are useful in the case of structural traps.
