Saff, Arthur David Snider, 2013-07-18 This book provides a comprehensive introduction to complex variable theory and its applications to current engineering problems and is designed to make the fundamentals of the subject more easily accessible to readers who have little inclination to wade through the rigors of the axiomatic approach. Modeled after standard calculus books both in level of exposition and layout, it incorporates physical applications throughout so that the mathematical methodology appears less sterile to engineers. It makes frequent use of analogies from elementary calculus or algebra to introduce complex concepts, includes fully worked examples, and provides a dual heuristic-analytic discussion of all topics. A downloadable MATLAB toolbox, a state-of-the-art computer aid, is available. **KEY TOPICS:** Complex Numbers, Analytic Functions, Elementary Functions, Complex Integration, Series Representations for Analytic Functions, Residue Theory, Conformal Mapping, The Transforms of Applied Mathematics, MATLAB ToolBox for Visualization of Conformal Maps, Numerical Construction of Conformal Maps, Table of Conformal Mappings, Features coverage of Julia Sets, modern exposition of the use of complex numbers in linear analysis, e.g. AC circuits, kinematics, signal processing, applications of complex algebra in celestial mechanics and gear kinematics, and an introduction to Cauchy integrals and the Sokhotskyi-Prémeijer formulas. **MARKET:** For mathematicians and engineers interested in Complex Analysis and Mathematical Physics. Network Analysis Mac Elwyn Van Valkenburg, 1964 **Computer Analysis of Circuits** David J. Comer, 1971 **Linear System Theory** Lotfi Zadeh, Charles Desoer, 2008-07-24 The state space approach is widely used in systems ranging from industrial robots to space guidance control. This landmark in the technique's development and applications was written by two pioneers in the field, Lotfi A. Zadeh and Charles A. Desoer, who teach in the Department of Electrical Engineering and Computer Science at the University of California Berkeley. Starting with a self-contained introduction to system theory, the authors explain basic concepts, presenting each idea within a carefully integrated framework of numerous illustrative examples. Most of the text concerns the application of the state space approach to systems described by differential equations. Problems of stability and controllability receive particular attention, and connections between the state space approach and classical techniques are highlighted. The properties of transfer functions are covered in separate chapters. Extensive appendices feature complete and self-contained expositions of delta functions and distributions, the Laplace and Fourier transform theory, the theory of infinite-dimensional linear vector spaces, and functions of a matrix. **Digital Computer Analysis of Passive Networks** George Winston Zobrist, Gladwyn Vaile Lago, 1965 **Topological Analysis and Synthesis of Communication Networks** Wan-hui Kim, Tien-wên Ch'ien, 1962 Presents a uniform approach to various engineering problems such as analysis and synthesis of electrical networks, sampled data, feedback control systems, switching networks, and communications nets. *Electrical Network Theory* K.
