

Quantum Leap Post lab Questions

1. Construct a bar graph for each target sheet. Label the horizontal axis as the area number (1-6) and the vertical axis for the number of hits. Space the bars evenly, making each the same width. Draw the height of each bar proportional to the number of hits in that area.
2. What area on each target sheet received the most hits?
3. Why don't all marbles dropped from a specified height land in the same spot? (do not say "human error")
4. As the height of the drop increases, what happens to the probability of the marble landing in one of the lower numbered areas? How does this correspond with a change in energy level in an atom's electron?
