

Table 1.1 Clinical Implications of Adolescent Brain Research

- Recklessness may be related to a lesser ability during adolescence to utilize brain regions best equipped to assess risks and benefits.
- Maturation of other regions of the prefrontal cortex is consistent with observed gains in working memory, emotion regulation, and capacity for long-term planning.
- Impulsivity, shortsightedness, and risk-taking behaviors are, at least in part, biologically driven.
- The brain's amygdala is associated with emotional and gut responses. Imaging studies suggest that teenagers, to a greater extent than adults, when asked to interpret emotional information, use this reactive part of the brain rather than the more "thinking" region of the frontal cortex.
- Campaigns designed to change adolescents' thinking (e.g., cognitive-behavioral therapy) around smoking, drunk driving, or unsafe sex may not be sufficiently effective on their own. They may need to be bolstered by external controls, such as parental oversight, supervision at school proms, legal sanctions for selling cigarettes to minors, and strict drinking and driving legislation.
- Parents, counselors, or health care practitioners should view risk-taking behaviors in a developmental context rather than resorting to such overly simplified attributions as poor character or negative peer pressure.
