

# 14 Mendel and the Gene Idea

## KEY CONCEPTS

- 14.1** Mendel used the scientific approach to identify two laws of inheritance. p. 270
- 14.2** Probability laws govern Mendelian inheritance. p. 276
- 14.3** Inheritance patterns are often more complex than predicted by simple Mendelian genetics. p. 278
- 14.4** Many human traits follow Mendelian patterns of inheritance. p. 284

## Study Tip

**Solving genetics problems:** In Figure 14.5, you'll learn how to predict the offspring of a genetic cross with a Punnett square, like the example shown below. For crosses shown in other figures, cover up the Punnett square and draw your own. Also, check out the Tips for Genetics Problems at the end of the chapter.

**Figure 14.1** Flower color was one of the many characteristics of pea plants studied by Gregor Mendel. By breeding pea plants over many generations and carefully counting the types of offspring, Mendel developed a theory of inheritance that is the basis of modern genetics.

## How are traits, such as the purple or white color of flowers, transmitted from parents to offspring?

Alternative versions of a gene (alleles) account for different traits.

Each parent cell has two alleles for each character, such as flower color. Here, the alleles are identical in each parent.

The two alleles segregate (separate) during gamete formation, ending up in different gametes. (Law of Segregation)

Offspring inherit one allele from each parent. When the two alleles are different, one allele (here, purple) determines the appearance.

When the offspring reproduces, the same principle applies: The alleles segregate, ending up in different gametes.
