Landscape Genetics Niko Balkenhol, Samuel Cushman, Andrew Storfer, Lisette Waits, 2015-11-09 LANDSCAPE GENETICS CONCEPTS METHODS APPLICATIONS LANDSCAPE GENETICS CONCEPTS METHODS APPLICATIONS Edited by Niko Balkenhol Samuel A Cushman Andrew T Storfer Lisette P Waits Landscape genetics is an exciting and rapidly growing field melding methods and theory from landscape ecology and population genetics to address some of the most challenging and urgent ecological and evolutionary topics of our time Landscape genetic approaches now enable researchers to study in detail how environmental complexity in space and time affect gene flow genetic drift and local adaptation However learning about the concepts and methods underlying the field remains challenging due to the highly interdisciplinary nature of the field which relies on topics that have traditionally been treated separately in classes and textbooks In this edited volume some of the leading experts in landscape genetics provide the first comprehensive introduction to underlying concepts commonly used methods and current and future applications of landscape genetics Consistent with the interdisciplinary nature of the field the book includes textbook like chapters that synthesize fundamental concepts and methods underlying landscape genetics Part 1 chapters on advanced topics that deserve a more in depth treatment Part 2 and chapters illustrating the use of concepts and methods in empirical applications Part 3 Aimed at beginning landscape geneticists and experienced researchers alike this book will be helpful for all scientists and practitioners interested in learning teaching and applying landscape genetics *Applying Landscape Ecology in Biological Conservation* Kevin Gutzwiller, 2011-06-27 Landscape ecology and conservation biology are rapidly developing disciplines and a current synthesis of principles and applications in these two fields is needed under one cover Many managers are not applying principles of landscape ecology in efforts to conserve biota yet the loss of biological diversity could be reduced if broad scale processes and patterns were consistently considered in management and conservation decisions Bringing together insights from leaders in landscape ecology and conservation biology this book explains how our knowledge about landscape ecology can help us understand manage and maintain biodiversity Beyond explaining pertinent concepts of landscape ecology and biological conservation and describing examples of their use in management research and planning this book also distills principles for applying landscape ecology in conservation identifies gaps in current knowledge and provides research approaches to fill those voids The book is divided into five parts the first part introduces the book and discusses what landscape ecology is and why it is important to biological conservation The second deals with multiple scales connectivity and organism movement The third part discusses landscape change and how this affects biodiversity and the fourth part covers conservation planning The final part presents a synthesis that identifies overarching principles pervasive constraints and realistic prospects for applying landscape ecology in biological conservation Conservationists land use planners and ecologists will find this book to be an essential resource Foreword by Richard T T Forman *Landscape Genetics* Niko

Balkenhol, Samuel Cushman, Andrew Storfer, Lisette Waits, 2015-11-09 **LANDSCAPE GENETICS CONCEPTS METHODS APPLICATIONS** Edited by Niko Balkenhol Samuel A Cushman Andrew T Storfer Lisette P Waits Landscape genetics is an exciting and rapidly growing field melding methods and theory from landscape ecology and population genetics to address some of the most challenging and urgent ecological and evolutionary topics of our time Landscape genetic approaches now enable researchers to study in detail how environmental complexity in space and time affect gene flow genetic drift and local adaptation However learning about the concepts and methods underlying the field remains challenging due to the highly interdisciplinary nature of the field which relies on topics that have traditionally been treated separately in classes and textbooks In this edited volume some of the leading experts in landscape genetics provide the first comprehensive introduction to underlying concepts commonly used methods and current and future applications of landscape genetics Consistent with the interdisciplinary nature of the field the book includes textbook like chapters that synthesize fundamental concepts and methods underlying landscape genetics Part 1 chapters on advanced topics that deserve a more in depth treatment Part 2 and chapters illustrating the use of concepts and methods in empirical applications Part 3 Aimed at beginning landscape geneticists and experienced researchers alike this book will be helpful for all scientists and practitioners interested in learning teaching and applying landscape genetics Agents and Implications of Landscape Pattern Dean L Urban, 2023-10-11 This is an ecology textbook focused on key principles that underpin research and management at the landscape scale It covers 1 agents of pattern the physical template biotic processes and disturbance regimes 2 scale and pattern why scale matters how to scale with data and inferences using landscape pattern metrics and 3 implications of pattern for metapopulations communities and biodiversity and ecosystem processes The last two chapters address emerging issues urban landscapes and adapting to climate change This book stems from two graduate level courses in Landscape Ecology taught at the Nicholas School of the Environment at Duke University The subject has evolved over time from a concepts based overview of what landscape ecology is to a more applied practicum on how one does landscape ecology As landscape ecology has matured as a discipline its perspectives on spatial heterogeneity and scale have begun to permeate into a wide range of other fields including conservation biology ecosystem management and ecological restoration Thus this textbook will bring students from diverse backgrounds to a common level of understanding and will prepare them with the practical knowledge for a career in conservation and ecosystem management Essentials of Landscape Ecology Kimberly A. With, 2019-07-01 Human activity during the Anthropocene has transformed landscapes worldwide on a scale that rivals or exceeds even the largest of natural forces Landscape ecology has emerged as a science to investigate the interactions between natural and anthropogenic landscapes and ecological processes across a wide range of scales and systems from the effects of habitat or resource distributions on the individual movements gene flow and population dynamics of plants and animals to the human alteration of landscapes affecting the structure of

biological communities and the functioning of entire ecosystems to the sustainable management of natural resources and the ecosystem goods and services upon which society depends This novel and comprehensive text presents the principles theory methods and applications of landscape ecology in an engaging and accessible format that is supplemented by numerous examples and case studies from a variety of systems including freshwater and marine scapes

Conservation Biology Fred Van Dyke,Rachel L. Lamb,2020-07-07 This book provides a thorough up to date examination of conservation biology and the many supporting disciplines that comprise conservation science In this the Third Edition of the highly successful Conservation Biology Foundations Concepts Applications the authors address their interdisciplinary topic as it must now be practiced and perceived in the modern world Beginning with a concise review of the history of conservation the authors go on to explore the interplay of conservation with genetics demography habitat and landscape aquatic environments and ecosystem management and the relationship of all these disciplines to ethics economics law and policy An entirely new chapter The Anthropocene Conservation in a Human Dominated Nature breaks new ground in its exploration of how conservation can be practiced in anthropogenic biomes novel ecosystems and urban habitats The Third Edition includes the popular Points of Engagement discussion questions used in earlier editions and adds a new feature Information Boxes which briefly recap specific case histories described in the text A concluding chapter offers insight into how to become a conservation professional in both traditional and non traditional roles The authors Fred Van Dyke and Rachel Lamb draw on their expertise as field biologists wildlife managers consultants to government and industry and scholars of environmental law policy and advocacy as well as their many years of effective teaching experience Informed by practical knowledge and acquired skills the authors have created a work of exceptional clarity and readability which encompasses both systemic foundations as well as contemporary developments in the field Conservation Biology Foundations Concepts Applications will be of invaluable benefit to undergraduate and graduate students as well as to working conservation scientists and managers This is an amazing resource for students faculty and practitioners both new and experienced to the field Diane Debinski PhD Unexcelled wisdom for living at home on Wonderland Earth the planet with promise destined for abundant life Holmes Rolston PhD Van Dyke and Lamb have maintained the original text s emphasis on connecting classical ecological and environmental work with updated modern applications and lucid examples But more importantly the third edition contains much new material on the human side of conservation including expanded treatments of policy economics and climate change Tim Van Deelen PhD Fred Van Dyke and Rachel Lamb break new ground in both the breadth and depth of their review and analysis of this crucially important and rapidly changing field Any student or other reader wishing to have a comprehensive overview and understanding of the complexities of conservation biology need look no further this book is your

starting point Simon N Stuart PhD Anyone who teaches talks or writes and works on Conservation Biology needs this latest edition of Conservation Biology Foundations Concepts Applications 3rd edition by Fred Van Dyke and Rachel L Lamb This will be useful to both beginners and experts as well The authors included almost all important issues in relation to conservation biology This is really an outstanding book Bidhan Chandra Das Professor Ecology Branch Department of Zoology University of Rajshahi Bangladesh **Habitat Modeling, Landscape Genetics, and Habitat Connectivity for the Mohave Ground Squirrel to Guide Renewable Energy Development** Todd C. Conservation Genetics [symposium on Conservation Genetics Held in May 1993, Aarhus, Denmark] Volker Loeschcke, Jürgen Tomiuk, Subodh K. Jain, 1994 It follows naturally from the widely accepted Darwinian dictum that failures of populations or of species to adapt and to evolve under changing environments will result in their extinction Population geneticists have proclaimed a centerstage role in developing conservation biology theory and applications However we must critically reexamine what we know and how we can make rational contributions We ask Is genetic variation really important for the persistence of species Has any species become extinct because it ran out of genetic variation or because of inbreeding depression Are demographic and environmental stochasticity by far more important for the fate of a population or species than genetic stochasticity genetic drift and inbreeding Is there more to genetics than being a tool for assessing reproductive units and migration rates Does conventional wisdom on inbreeding and magic numbers or rules of thumb on critical effective population sizes MVP estimators reflect any useful guidelines in conservation biology What messages or guidelines from genetics can we reliably provide to those that work with conservation in practice Is empirical work on numerous threatened habitats and taxa gathering population genetic information that we can use to test these guidelines These and other questions were raised in the invitation to a symposium on conservation genetics held in May 1993 in pleasant surroundings at an old manor house in southern Jutland Denmark Conservation Genetics in the Neotropics Pedro M. Galetti Jr., 2023-08-29 This book explores how genetics and the new technologies in genomics have been used for conservation of plants and animals in the Neotropics It shows the new perspective for conservation genetics beyond the use of theoretical and methods in genetics at species level and presents how genetics and genomics can be used for assessing communities Conservation genetics and genomics are presented as a helpful field of study for resolving taxonomic uncertainties and hidden biodiversity understanding populations and extinction risk genetic management wildlife forensic genetics assessing biology and molecular ecology assessing communities conservation genomics and the use of conservation biology and genetics in science learning highlighting case studies in the Neotropics Applications of conservation genetics for management or policy decision making planning and implementation of conservation practice in the Neotropics are addressed across chapters This book will interest to researchers and students in conservation genetics and biology

conservation interested in the Neotropics Stakeholders and decision makers in conservation biology may also find this book useful *Models for Planning Wildlife Conservation in Large Landscapes* Joshua Millspaugh, Frank R. Thompson, 2009 Intended to provide a recipe for successful development of wildlife habitat models and their implementation in conservation planning the book could be used in studying wildlife habitat models conservation planning and management techniques Additionally it may be a supplemental text in courses dealing with quantitative assessment of wildlife populations Additionally the length of the book would be ideal for graduate student seminar course Using wildlife habitat models in conservation planning is of considerable interest to wildlife biologists With ever tightening budgets for wildlife research and planning activities there is a growing need to use computer methods Use of simulation models represents the single best alternative However it is imperative that these techniques be described in a single source Moreover biologists should be made aware of alternative modeling techniques *Wildlife Research*, 2015 **Predictive Species and Habitat Modeling in Landscape Ecology** C. Ashton Drew, Yolanda F. Wiersma, Falk Huettmann, 2010-11-25 Most projects in Landscape Ecology at some point define a species habitat association These models are inherently spatial dealing with landscapes and their configurations Whether coding behavioral rules for dispersal of simulated organisms through simulated landscapes or designing the sampling extent of field surveys and experiments in real landscapes landscape ecologists must make assumptions about how organisms experience and utilize the landscape These convenient working postulates allow modelers to project the model in time and space yet rarely are they explicitly considered The early years of landscape ecology necessarily focused on the evolution of effective data sources metrics and statistical approaches that could truly capture the spatial and temporal patterns and processes of interest Now that these tools are well established we reflect on the ecological theories that underpin the assumptions commonly made during species distribution modeling and mapping This is crucial for applying models to questions of global sustainability Due to the inherent use of GIS for much of this kind of research and as several authors research involves the production of multicolored map figures there would be an 8 page color insert Additional color figures could be made available through a digital archive or by cost contributions of the chapter authors Where applicable would be relevant chapters GIS data and model code available through a digital archive The practice of data and code sharing is becoming standard in GIS studies is an inherent method of this book and will serve to add additional research value to the book for both academic and practitioner audiences *Landscape Genetic Study of Feral Pigs (*Sus Scrofa*) in the Central Coast Region of California* Elizabeth Rose Heeg, 2006 **Landscape Genetics and Phylogenetic Relationships in the *Ambystoma Macrodictylum* Species Complex** Wesley Keith Savage, 2008 **A Changing World** Felix Kienast, Otto Wildi, Sucharita Ghosh, 2007-03-16 Landscape Research has been established as an interdisciplinary field dealing with complex environmental processes at multiple spatial and temporal scales During the course of its history various societal technological and philosophical stimuli have shaped Landscape Research e g the declaration of Landscape Ecology in

the 1930s and contemporary global technological and societal developments Modern landscape research presently uses mathematics statistics and advanced simulation techniques to combine empirical observations with known theories from ecology physics geography social science and so on Knowledge is thus updated and quantified via models that are used for estimation hypothesis testing prediction and assessment of scenarios Advances in the computational sciences e g fast computers and vast array of software space science e g remote sensing and biological sciences e g genetics as well as new perspectives in the social sciences play important roles Research findings are implemented in conservation management urban planning and global change mitigation strategies This book identifies emerging fields and new challenges that are discussed within the framework of the driving forces of Landscape Development Rather than offering a comprehensive overview of all fields of Landscape Research the book addresses hot topics emphasizing major contemporary trends in these fields
