

Doppler

Chapter 19

Doppler

- A moving train with a trumpet player holding the same tone for a very long time travels from your left to your right.
- The tone changes relative the motion of you (receiver) and the player (sound source)
- The f appears to increase as it approaches you from the left and decreases as it moves away from you on your right.
- This change in frequency is a Doppler shift and is called Doppler Frequency

Doppler Frequency

- The frequency only changes when there is a change in the source and receiver position.
- There is no change when the source and receiver remain constant.
- This is the primary physical principle which is used to measure the velocity of blood in a vessel!

Doppler shift

- Defined as The f shift created between the transmitted and received f by an interface moving with velocity at an angle to the sound source.
- It is a low f that rides or uses as a carrier the higher transmitted f
- Separating the two frequencies is done in the system an is call?

Doppler shift

- Doppler shift (Hz) = reflected f - transmitted f
- A transmitted f has a of 5 MHz
- When its reflected off moving blood cells the measures 5.003 MHz
- What is the Doppler shift?
- Its reflects a positive shift because the frequency is higher than the carrier f

Doppler shift

- We already know this shift is created when the transmitted sound strikes moving vessels.
- Positive shifts are created when the change is higher than the original f
- Negative shifts are created when the change is lower than the original f
