Stochastic and Statistical Methods in Hydrology and Environmental Engineering Keith W. Hipel, A. Ian McLeod, U.S. Panu, Vijay Singh, Liping Fang, 1994-08-31 Volume 1 edited by Keith W Hipel In this landmark collection of papers highly respected scientists and engineers from around the world present the latest research results in extreme value analyses for floods and droughts Two approaches that are commonly employed in flood frequency analyses are the maximum annual flood and partial duration series or peak over threshold procedures Recent theoretical advances as well as illustrative applications are described in detail for each of these approaches Additionally droughts and storms are systematically studied using appropriate probabilistic models A major part of the volume is devoted to frequency analyses and fitting extreme value distributions to hydrological data Other thought provoking topics include regionalization techniques distributed models entropy and fractal analysis Volume 1 is of interest to researchers teachers students and practitioners who wish to place themselves at the leading edge of flood frequency and drought analyses Volume 2 edited by Keith W Hipel World renowned scientists present valuable contributions to stochastic and statistical modelling of groundwater and surface water systems The philosophy of probabilistic modelling in the hydrological sciences is put into proper perspective and the importance of stochastic differential equations in the environmental sciences is explained and illustrated The new research ideas put forward in groundwater modelling will assist decision makers in tackling challenging problems such as controlling pollution of underground aquifers and obtaining adequate water supplies Additionally different types of stochastic models are used in modelling a range of interesting surface water problems Other topics covered in this landmark volume include stochastic optimization moment analysis carbon dioxide modelling and rainfall prediction Volume 2 is of interest to researchers teachers students and practitioners who wish to be at the leading edge of stochastic and statistical modelling in the environmental sciences Volume 3 edited by Keith W Hipel A Ian McLeod U S Panu Vijay P Singh International experts from

around the globe present a rich variety of intriguing developments in time series analysis in hydrology and environmental engineering. Climatic change is of great concern to everyone and significant contributions to this challenging research topic are put forward by internationally renowned authors. A range of interesting applications in hydrological forecasting are given for case studies in reservoir operation in North America, Asia and South America. Additionally, progress in entropy research is described and entropy concepts are applied to various water resource systems problems. Neural networks are employed for forecasting runoff and water demand. Moreover, graphical nonparametric and parametric trend analyses methods are compared and applied to water quality time series. Other topics covered in this landmark volume include spatial analyses, spectral analyses and different methods for stream flow modelling. Volume 3 constitutes an invaluable resource for researchers, teachers, students and practitioners who wish to be at the forefront of time series analysis in the environmental sciences. Volume 4, edited by Keith W. Hipel and Liping Fang, in this landmark set of papers, experts from around the world present the latest and most promising approaches to both the theory and practice of effective environmental management. To achieve sustainable development, organizations and individual citizens must comply with environmental laws and regulations. Accordingly, a major contribution of this book is the presentation of original techniques for designing effective environmental policies, regulations, inspection procedures and monitoring systems. Interesting methods for modelling risk and decision making problems are discussed from an environmental management perspective. Moreover, knowledge based techniques for handling environmental problems are also investigated. Finally, the last main part of the book describes optimal approaches to reservoir operation and control that take into account appropriate multiple objectives. Volume 4 is of direct interest to researchers, teachers, students and practitioners concerned with the latest developments in environmental management and sustainable development.

Objectives The current global environmental crisis has reinforced the need for developing flexible mathematical models to obtain a better understanding of environmental problems so that effective remedial action can be taken. Because natural phenomena occurring in hydrology and environmental engineering usually behave in random and probabilistic fashions, stochastic and statistical models have major roles to play in the protection and restoration of our natural environment. Consequently, the main objective of this edited volume is to present some of the most up to date and promising approaches to stochastic and statistical modelling, especially with respect to groundwater and surface water applications.

Contents As shown in the Table of Contents, the book is subdivided into the following main parts: GENERAL ISSUES, PART I, PART II, GROUNDWATER, PART III, SURFACE WATER, PART IV, STOCHASTIC OPTIMIZATION, PART V, MOMENT ANALYSIS, PART VI, OTHER TOPICS. Part I raises some thought provoking issues about probabilistic modelling of hydrological and environmental systems. The first two papers in Part I are in fact keynote papers delivered at an international environmental conference held at the University of Waterloo in June 1993 in honour of Professor T. E. Unny. In

his keynote paper Dr S J Burges of the University of Washington places into perspective the historical and future roles of stochastic modelling in hydrology and environmental engineering Additionally Dr Burges stresses the need for developing a sound scientific basis for the field of hydrology Professor P E **Stochastic and Statistical Methods in Hydrology and Environmental Engineering** Keith W. Brown, 2013-04-17 Since the greenhouse effect emerged as a predictable threat necessitating the evaluation of its future impact on the environment in the various parts of the globe interest in the climate changes during the Holocene has gained momentum The background can be summarized by the sentence The past is a key to the future As a matter of fact this sentence is in the opposite direction on the dimension of time to the principle adopted by the founders of the science of geology They proposed that geological processes in the present should be used as a key for understanding the past Another reason for the interest in the history of the climate of the Holocene can be described as the renaissance of a modified deterministic approach to the inter relation between physical and human geography This relates in the first place to the fact that various investigations especially as carried out by Hubert Lamb showed that the sequence of climate changes previously suggested by Blytt and Sernander for Europe and adopted by most Holocene climatologists was far too general and that there were more climate changes during recent history than previously taken account of In the second place it was found out that these changes had had an impact on the history of human communities Thus one can conclude that once the taboo on geographical determinism i e **STOCHASTIC and Statistical Methods in Hydrology and Environmental Engineering** Keith W.
