The water cycle and biological cycles such as photosynthesis, respiration, decomposition, and cellular respiration, which shows that matter is recycled in the ecosystem and is not lost.</p> <p>Photosynthesis is a process by which plants use sunlight to produce energy for use in growth and development. Plants take in carbon dioxide and water from the soil and use them to produce glucose and oxygen. The glucose is used for energy and growth. Cellular respiration is the process by which organisms use oxygen to produce energy for their cells. Cellular respiration releases carbon dioxide and water as waste products.</p> <p>Decomposition is the process by which dead organic matter is broken down into simpler substances. Decomposers, such as bacteria and fungi, break down dead organic matter into simpler substances, releasing carbon dioxide and water. The carbon dioxide is used by plants for photosynthesis, and the water is used by plants and animals for cellular respiration.</p> <p>The water cycle is the process by which water moves through the environment. Water evaporates from the surface of the ocean, lakes, and rivers into the atmosphere. The water vapor in the atmosphere condenses into clouds, which release rain or snow. The water then falls to the ground and runs off into the ocean or infiltrates the ground as groundwater. The water cycle is a continuous process that recycles water in the environment.</p> <p>Read the passage again for each question.</p> <p>1.
