Spin Hall Effect And Spin Orbit Torques

Spin Hall Effect And Spin Orbit Torques:

Current-driven Spin-orbit Torques in Ferromagnetic Heterostructures Jun Wu, 2017 The spin Hall effect SHE is the generation of spin separation by a charge current in a heavy metal HM with strong spin orbit interaction The generated pure spin current orthogonal to the charge current can exert a torque on the magnetization of an adjacent ferromagnetic layer FM in FM HM bilayer Due to the inversion symmetry breaking in such FM HM bilayer there exists a Rashba effect at the interface that can cause spin accumulation at the interface The accumulated spin can also exert a torque on the magnetization of the ferromagnetic layer The torque arising from the current driven SHE or Rashba effect is referred to as spin orbit torque SOT There are two types of SOT field like FL and damping like DL SOT both can cause FM layer magnetization reorientation or switching SOT has attracted intensive interest recently due to its potential application in low energy memory and logic devices DL SOT has been observed and widely investigated by researchers However FL SOT was rarely observed and neglected in most cases since it only can be measured in very thin FM layer because of the short spin dephasing length usually on the order of several atomic layers In this work we first demonstrate the existence and observation of the effective field of FL SOT in a CoFeB Ta bilayer by the spin transfer torque ferromagnetic resonance method Then we quantitatively determine the FL SOT in NiFe Pt system using the second order planar Hall effect PHE It is found that FL SOT persists even with an insertion of Cu spacer layer between NiFe and Pt which indicates that the SHE is the dominant mechanism for SOT In order to investigate the interfacial and bulk effects of SOT in FM HM bilayer both the DL and FL SOTs are measured in the CoFeB Pt system by the polar magneto optical Kerr effect MOKE and second order PHE respectively We found that the SHE is also the dominant mechanism in CoFeB Pt system However there is also a distinct interfacial contribution which is attributed to the Rashba effect There are two mechanisms contributing to the SHE intrinsic and extrinsic effect We show that the SHE in Au Cu alloy can be enhanced by the extrinsic scattering compared to pure Au or Cu It is also found that the DL SOT and FL SOT depend on temperature very differently in NiFe AuCu system A nearly linear dependence between the spin Hall angle and longitudinal resistivity suggests that skew scattering one of the extrinsic effect for SHE may be the dominant mechanism in Au Cu alloy

effort has been dedicated to identifying the dominant mechanism of the SOTs however the underlying mechanism for the SOC driven phenomena remained unsettled In this thesis we develop a sensitive SOT magnetometer based on the magneto optic Kerr effect MOKE that measures the SOTs for HM FM bilayers over a wide thickness range We observe that the DT inversely scales with the ferromagnet thickness and the FT has a threshold effect that appears only when the ferromagnetic layer is thinner than 1 nm Through a thickness dependence study with an additional copper insertion layer at the interface we conclude that both SHE and Rashba effect exist in HM FM heterostructures The relative strengths of their contributions depend on the material system We have also demonstrated that MOKE with normal incidence light can be used to obtain the DT and FT in HM FM bilayers by analyzing the polar Kerr effect as well as the quadratic Kerr effect The two effects can be distinguished by properly selecting the polarization of the incident light We study a series of Pt Py bilayers to verify the accuracy of this method The angular dependence of SOTs in Ta 2 nm CoFeB 1 nm MgO 3 nm trilayers with perpendicular magnetization is quantified based on polar MOKE with field calibration A strong angular dependence is observed that is different from the previous experimental observations Based on this strong angle dependence we conclude there is a strong Rashba effect in this system Simultaneous detection of current driven DT and FT in HM FM bilayers by measuring all three magnetization components and using a vector resolved MOKE technique based on quadrant detection has also been accomplished The technique can be easily extended to measure SOTs in systems with perpendicular magnetization as well as in systems with arbitrary magnetization direction

Relativistic Electronic Transport Theory Stephan Lowitzer, 2010

Spintronics is an emerging technology that exploits the intrinsic spin of the electron and its associated magnetic moment in addition to its fundamental electronic charge The central issue of this multidisciplinary field is the manipulation of the spin degree of freedom in solid state systems Discoveries in recent years have inspired a new route in spintronic research which needs no ferromagnetic components The research field spintronic without magnetism is based on the possibility to manipulate electric currents via spin orbit coupling only The spin Hall effect SHE is one of the most promising effects for the generation of spin polarized currents which is even present in non magnetic materials The SHE appears when an electric current flows through a medium with spin orbit coupling present leading to a spin current perpendicular to the charge current In this work the SHE as well as the anomalous Hall effect AHE are investigated on a first principles level using the spin polarized fully relativistic Korringa Kohn Rostoker Green s function method SPR KKR GF in conjunction with the linear response Kubo Streda formalism Intrinsic as well as extrinsic contributions to the SHE AHE are treated on equal footing This opened up for the first time the possibility to reliably decompose the SHE AHE into skew and side jump scattering as well as intrinsic contributions in a quantitative manner

Magnetization Dynamics in Pt/Ni₈₀Fe₂₀ Nanowires Induced by Spin Hall Effect Liu Yang, 2015

Spin current is the flow of electron spin angular momentum It can either be partially spin polarized current generated due to the exchange interactions of spins and local magnetization or pure spin current generated from

spin orbit interaction Both sources of spin current are under intensive study for their efficient interaction with nanoscale magnetic structures and potential application of magnetoresistive random access memory MRAM spin torque nano oscillators STNOs and other innovative devices In this dissertation spin Hall effect mediated magnetization dynamics in Platinum Permalloy nanowires are excited by different means and studied experimentally This includes steady state self oscillation of magnetization in a ferromagnetic nanowire serving as the active region of a spin torque oscillator driven by spin orbit torques Our work demonstrates that magnetization self oscillations can be excited in a one dimensional magnetic system and that dimensions of the active region of spin torque oscillators for the first time can be extended beyond the nanometer length scale We also demonstrate that via proper design of the nanowire shape which results in spatial non uniform spin current density we can significantly decrease the phase noise of spin orbit torque oscillators It also stabilizes the single mode generation regime and points out a path for partial control of multi mode excitation in nanostructures We also parametrically excite magnetization dynamics in the nanowires and it demonstrates that nonlinear dynamic magnetic effect can have a larger efficiency than the direct linear excitation in spin Hall structures and it provides additional information about excited spin wave mode systems owing to its threshold nature that is unavailable from direct excitation
