

EXPERIMENT 2: THE INVERSE SQUARE LAW

The inverse square law is a concept that comes up in several areas of physics. This experiment does not demonstrate how gravity "works," but it aims to give you a better picture of how the force of gravity diminishes greatly as distance increases. In Figure 8, gravity is represented by the amount of light spread out over an area, A .

PROCEDURE

1. Turn the Styrofoam cup upside down and place the face of the flashlight on the center of the bottom of the cup. Use a pen or pencil to poke holes around the face of the flashlight until there are enough holes to easily punch out a hole the size of the flashlight face.
2. Insert the flashlight to the cup through the hole so that light shines up through the bottom.
3. In a dark room, turn on the flashlight and hold the end of the cup 5 cm from the wall.
4. This distance will be the closest distance to the wall at which you will record data. Therefore, this will be considered a 10 on the intensity scale. Record an intensity of 10 in Table 2.
5. Use the tape measure to measure the diameter of the circle of light. Record the diameter in Table 2 (if you wish to try distances more than about one meter, get a partner or parent to help with your measurements).
6. Calculate the area of the circle of light. Record the area in Table 2.
7. Repeat Steps 3 - 6 for five more distances, each time, moving the flashlight a few centimeters away from the wall.

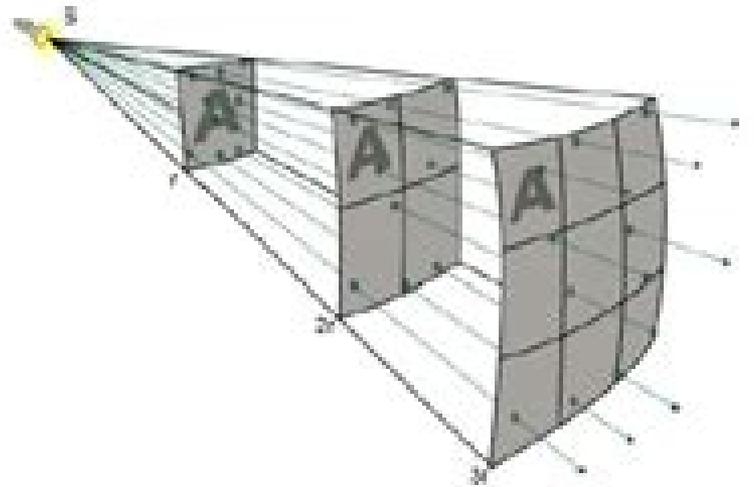

Figure 8: Inverse square law. "A" represents the original area at distance, d . Note the number of arrows passing through each area at different distances.
