

ROCKET SCIENCE

THE BASICS OF A ROCKET ENGINE

There are four main components in a simplified *liquid-fuel* rocket engine: the **Pumps**, the **Turbine**, the **Combustion Chamber**, and the **Nozzle**. Each of these play a critical role in creating enough thrust to propel humans and payloads into Earth orbit... and beyond.

"With no air in space, liquid-fueled rockets need to carry both oxidizer (usually oxygen) and fuel (usually hydrogen or kerosene) in specialized tanks. Liquid Hydrogen is the most powerful rocket fuel. The objective of rocket design is to keep the hardware weight as low as possible. Using Liquid Hydrogen allows for a smaller (and lighter) engine."

1 PUMP IT UP

To reduce the total weight of the tanks the fuel and oxygen propellants are injected through extreme cooling. The **Pumps** increase the pressure of these low propellants before sending them on down the line.

2 COOL FUEL

Because of the high temperatures created from burning propellants within the engine, the **coolant** fuel is pumped through special passages to keep the **Combustion Chamber** and **Nozzle** from melting. The nozzle is designed to act as a heat exchanger, keeping the metal components cool while expelling the liquid fuel to drive the turbine.

3 MINI ENGINE

After the fuel reaches through the coolant passages, it is cooled into the **turbopumps**. The pressurized fuel passes over the **Turbine**, causing it to rotate. This provides the power to operate the pumps.

4 LIGHT THE FIRE

Once the oxidizer and fuel enter the **Combustion Chamber**, they are ignited and burned to form a super heated, high-pressure gas. This pressure created by the pumps forces the gas through the narrow throat and out the **Nozzle**.

5 ACTION REACTION

As the gas accelerates through the throat and out the **Nozzle**, it generates thrust that pushes up toward the **Combustion Chamber**, much like the air escaping from an inflated balloon, thus propelling the rocket upwards.
