

Numerical Solution of Partial Differential Equations

In these notes we develop a method for generating, numerically, approximate solutions to the vibrating string problem

$$u_{tt}(x, t) = c^2 u_{xx}(x, t) \quad 0 \leq x \leq \ell \quad t \geq 0 \quad (\text{wave equation}) \quad (1)$$

$$u(x, 0) = f(x) \quad 0 \leq x \leq \ell \quad (\text{initial position}) \quad (2a)$$

$$u_t(x, 0) = g(x) \quad 0 \leq x \leq \ell \quad (\text{initial speed}) \quad (2b)$$

$$u(0, t) = L(t) \quad t \geq 0 \quad (\text{left boundary}) \quad (3a)$$

$$u(\ell, t) = R(t) \quad t \geq 0 \quad (\text{right boundary}) \quad (3b)$$

The function $u(x, t)$ gives the amplitude of the string at position x and time t . Equation (1) is the wave equation. It is the equation of motion for the vibrating string and is a consequence of Newton's law, $F = ma$. Equations (2a,b) specify the initial position and speed of the string and equations (3a,b) specify the position of the two ends of the string for all time.

The method will be an extension of those (like Euler's method, for example) used for generating, numerically, approximate solutions to the initial value problem

$$y'(t) = f(t, y(t)) \quad t \geq 0 \quad (\text{ode}) \quad (4)$$

$$y(0) = y_0$$

Recall that under Euler's method, rather than generating approximate values for $y(t)$ for all values of $t \geq 0$, we pick a step size Δt and consider only $t = 0, \Delta t, 2\Delta t, \dots, t_n = n\Delta t, \dots$. We approximate the ordinary differential equation (4) by an equation, that does not contain any derivatives and that involves only the times t_n , by approximating

$$y'(t_n) = \lim_{h \rightarrow 0} \frac{y(t_n + h) - y(t_n)}{h} \approx \frac{y(t_n + \Delta t) - y(t_n)}{\Delta t} = \frac{y(t_{n+1}) - y(t_n)}{\Delta t}$$

Denoting $y(t_n) = y_n$, this gives

$$\frac{y_{n+1} - y_n}{\Delta t} \approx y'(t_n) = f(t_n, y(t_n)) = f(t_n, y_n)$$

Numerical Solution of Partial Differential Equations in Science and Engineering Leon Lapidus, George F. Pinder, 1982 This book was written to provide a text for graduate and undergraduate students who took our courses in numerical methods It incorporates the essential elements of all the numerical methods currently used extensively in the solution of partial differential equations encountered regularly in science and engineering Because our courses were typically populated by students from varied backgrounds and with diverse interests we attempted to eliminate jargon or nomenclature that would render the work unintelligible to any student Moreover in response to student needs we incorporated not only classical and not so classical finite difference methods but also finite element collocation and boundary element procedures After an introduction to the various numerical schemes each equation type parabolic elliptic and hyperbolic is allocated a separate chapter Within each of these chapters the material is presented by numerical method Thus one can read the book either by equation type or numerical approach Preface page v

Solving Numerical PDEs: Problems, Applications, Exercises Luca Formaggia, Fausto Saleri, Alessandro Veneziani, 2012-04-05 This book stems from the long standing teaching experience

of the authors in the courses on Numerical Methods in Engineering and Numerical Methods for Partial Differential Equations given to undergraduate and graduate students of Politecnico di Milano Italy EPFL Lausanne Switzerland University of Bergamo Italy and Emory University Atlanta USA It aims at introducing students to the numerical approximation of Partial Differential Equations PDEs One of the difficulties of this subject is to identify the right trade off between theoretical concepts and their actual use in practice With this collection of examples and exercises we try to address this issue by illustrating academic examples which focus on basic concepts of Numerical Analysis as well as problems derived from practical application which the student is encouraged to formalize in terms of PDEs analyze and solve The latter examples are derived from the experience of the authors in research project developed in collaboration with scientists of different fields biology medicine etc and industry We wanted this book to be useful both to readers more interested in the theoretical aspects and those more concerned with the numerical implementation

Numerical Methods for Partial Differential Equations Sandip Mazumder, 2015-12-01 Numerical Methods for Partial Differential Equations Finite Difference and Finite Volume Methods focuses on two popular deterministic methods for solving partial differential equations PDEs namely finite difference and finite volume methods The solution of PDEs can be very challenging depending on the type of equation the number of independent variables the boundary and initial conditions and other factors These two methods have been traditionally used to solve problems involving fluid flow For practical reasons the finite element method used more often for solving problems in solid mechanics and covered extensively in various other texts has been excluded The book is intended for beginning graduate students and early career professionals although advanced undergraduate students may find it equally useful The material is meant to serve as a prerequisite for students who might go on to take additional courses in computational mechanics computational fluid dynamics or computational electromagnetics The notations language and technical jargon used in the book can be easily understood by scientists and engineers who may not have had graduate level applied mathematics or computer science courses Presents one of the few available resources that comprehensively describes and demonstrates the finite volume method for unstructured mesh used frequently by practicing code developers in industry Includes step by step algorithms and code snippets in each chapter that enables the reader to make the transition from equations on the page to working codes Includes 51 worked out examples that comprehensively demonstrate important mathematical steps algorithms and coding practices required to numerically solve PDEs as well as how to interpret the results from both physical and mathematic perspectives
