

Introduction to Linear Programming

Linear programming (LP) is a tool for solving optimization problems. In 1947, George Dantzig developed an efficient method, the simplex algorithm, for solving linear programming problems (also called LP). Since the development of the simplex algorithm, LP has been used to solve optimization problems in industries as diverse as banking, education, forestry, petroleum, and trucking. In a survey of Fortune 500 firms, 85% of the respondents said they had used linear programming. As a measure of the importance of linear programming in operations research, approximately 70% of this book will be devoted to linear programming and related optimization techniques.

In Section 3.1, we begin our study of linear programming by describing the general characteristics shared by all linear programming problems. In Sections 3.2 and 3.3, we learn how to solve graphically those linear programming problems that involve only two variables. Solving these simple LPs will give us useful insights for solving more complex LPs. The remainder of the chapter explains how to formulate linear programming models of real-life situations.

3.1 What Is a Linear Programming Problem?

In this section, we introduce linear programming and define important terms that are used to describe linear programming problems.

EXAMPLE 1 Giapetto's Woodcarving

Giapetto's Woodcarving, Inc., manufactures two types of wooden toys: soldiers and trains. A soldier sells for \$27 and uses \$10 worth of raw materials. Each soldier that is manufactured increases Giapetto's variable labor and overhead costs by \$14. A train sells for \$21 and uses \$9 worth of raw materials. Each train built increases Giapetto's variable labor and overhead costs by \$10. The manufacture of wooden soldiers and trains requires two types of skilled labor: carpentry and finishing. A soldier requires 2 hours of finishing labor and 1 hour of carpentry labor. A train requires 1 hour of finishing and 1 hour of carpentry labor. Each week, Giapetto can obtain all the needed raw material but only 100 finishing hours and 80 carpentry hours. Demand for trains is unlimited, but at most 40 soldiers are bought each week. Giapetto wants to maximize weekly profit (revenues $-$ costs). Formulate a mathematical model of Giapetto's situation that can be used to maximize Giapetto's weekly profit.

Solution In developing the Giapetto model, we explore characteristics shared by all linear programming problems.

Decision Variables We begin by defining the relevant **decision variables**. In any linear programming model, the decision variables should completely describe the decisions to be made (in this case, by Giapetto). Clearly, Giapetto must decide how many soldiers and trains should be manufactured each week. With this in mind, we define

Introduction To Linear Programming Solution Manual:

An Introduction to Linear Programming and Game Theory Paul R. Thie, 1988-06 A rigorous introduction to the theoretical concepts and computational techniques of linear programming and game theory Illustrates how mathematics can be used to understand and resolve real world problems Standard topics are covered the simplex algorithm duality sensitivity integer programming the transportation problem two person zero sum and non zero sum games and in the process mathematical model building is explained Material includes meaningful examples and numerous exercises to reinforce and enhance understanding Examples are used extensively and the exercises over 500 range in nature from model building and computation to theory In this edition five new sections have been added new problems included and material expanded and improved *USDA Forest Service General Technical Report PNW.*, 1976

Selecting Forest Residue Treatment Alternatives Using Goal Programming B. Bruce Bare, Brian F. Anholt, 1976 The use of goal programming for selecting forest residue treatment alternatives within a multiple goal framework is described The basic features of goal programming are reviewed and illustrated with a hypothetical problem involving the selection of residue treatments for 10 cutting units Twelve residue regeneration treatment combinations are evaluated by using physical economic and environmental goals Empirical results are reported for four different goal priority sets An interpretation of the sensitivity of the optimal treatment schedule associated with each priority set is also presented Results indicate that goal programming offers considerable promise as an operational decisionmaking tool Unresolved problems include the selection of decision variables and the quantification of goal attainment levels goal preferences and the relationships between forest residue treatment methods and managerial goals
