Breitman,2011-08-22 As computer systems evolve the volume of data to be processed increases significantly either as a consequence of the expanding amount of available information or due to the possibility of performing highly complex operations that were not feasible in the past Nevertheless tasks that depend on the manipulation of large amounts of information are still performed at large computational cost i e either the processing time will be large or they will require intensive use of computer resources In this scenario the efficient use of available computational resources is paramount and creates a demand for systems that can optimize the use of resources in relation to the amount of data to be processed This problem becomes increasingly critical when the volume of information to be processed is variable i e there is a seasonal variation of demand Such demand variations are caused by a variety of factors such as an unanticipated burst of client requests a time critical simulation or high volumes of simultaneous video uploads e g as a consequence of a public contest In these cases there are moments when the demand is very low resources are almost idle while conversely at other moments the processing demand exceeds the resources capacity Moreover from an economical perspective seasonal demands do not justify a massive investment in infrastructure just to provide enough computing power for peak situations In this light the ability to build adaptive systems capable of using on demand resources provided by Cloud Computing infrastructures is very attractive **Grid and Cloud**

Database Management Sandro Fiore,Giovanni Aloisio,2011-07-28 Since the 1990s Grid Computing has emerged as a paradigm for accessing and managing distributed heterogeneous and geographically spread resources promising that we will be able to access computer power as easily as we can access the electric power grid Later on Cloud Computing brought the promise of providing easy and inexpensive access to remote hardware and storage resources Exploiting pay per use models and virtualization for resource provisioning cloud computing has been rapidly accepted and used by researchers scientists and industries In this volume contributions from internationally recognized experts describe the latest findings on challenging topics related to grid and cloud database management By exploring current and future developments they provide a thorough understanding of the principles and techniques involved in these fields The presented topics are well balanced and complementary and they range from well known research projects and real case studies to standards and specifications and non functional aspects such as security performance and scalability Following an initial introduction by the editors the contributions are organized into four sections Open Standards and Specifications Research Efforts in Grid Database Management Cloud Data Management and Scientific Case Studies With this presentation the book serves mostly researchers and graduate students both as an introduction to and as a technical reference for grid and cloud database management The detailed descriptions of research prototypes dealing with spatiotemporal or genomic data will also be useful for application engineers in these fields
