

## Gulf Coast Refinery Solves Long Term Corrosion Problem by deploying 3D TRASAR® Technology for Crude Overhead Systems

REFINING PROCESS TREATMENT

Gulf coast refinery had a history of corrosion failures in the crude unit overhead exchangers for the past 10 years costing the refiner in excess of \$1.0 MM/year in equipment, labor, and lost production. The refinery in question was plugging tubes, retubing exchangers, or replacing exchangers as frequently as every eighteen months. Refer to Table 1 for a corrosion history. The biggest problem the customer faced, in trying to resolve this persistent corrosion problem, was clearly identify the contributing factors and directly linking these to unit performance and the exchanger failure rate. Table 4 summarizes the corrosion history for this system.

The customer goals were to eliminate or drastically reduce the corrosion allowing them to run turnaround without suffering any downtime or lost production due to corrosion failures. In addition to the

direct costs poor overhead performance was increasing the refiners safety, and environmental exposure. Despite valiant efforts poor corrosion performance could not be significantly reduced with the application of a traditional chemical treatment program. It was suspected that much of the corrosion damage occurring was episodic in nature and the direct result of operational changes. The customer needed a simple way to measure and track the corrosive conditions resulting from changes in operation linking these directly back to corrosion performance.

To meet the customers needs Nalco deployed our new 3D TRASAR Technology for Crude Overhead Systems. The 3D TRASAR for Crude Overhead Systems analyzer takes a stream of crude unit overhead sour water and in real time determines the

**Fouling in Refineries** James G. Speight, 2015-05-14 Fouling in Refineries is an important and ongoing problem that directly affects energy efficiency resulting in increased costs production losses and even unit shutdown requiring costly expenditures to clean up equipment and return capacity to positive levels This text addresses this common challenge for the hydrocarbon processing community within each unit of the refinery As refineries today face a greater challenge of accepting harder to process heavier crudes and the ongoing flow of the lighter shale oil feedstocks resulting in bigger challenges to balance product stability within their process equipment this text seeks to inform all relative refinery personnel on how to monitor fouling characterize the deposits and follow all available treatments With basic modeling and chemistry of fouling and each unit covered users will learn how to operate at maximum production rates and elongate the efficiency of their refinery s capacity Presents an understanding of the breakdown of fouling per refinery unit including distillation and coking units Provides all the factors crude types and refining blends that cause fouling especially the unconventional feedstocks and high acid crudes used today Helps users develop an analysis based treatment and control strategy that empowers them to operate refinery equipment at a level that prevents fouling from occurring
