## Abstract

Calcium ion ( $\text{Ca}^{2+}$ ) is a multifaceted signaling molecule that acts as an important second messenger. During the course of evolution, plants and animals have developed  $\text{Ca}^{2+}$  signaling in order to respond against diverse stimuli, to regulate a large number of physiological and developmental pathways. Our understanding of  $\text{Ca}^{2+}$  signaling and its components in physiological phenomena ranging from lower to higher organisms, and from single cell to multiple tissues has grown exponentially. The generation of  $\text{Ca}^{2+}$  transients or signatures for various stress factor is a well-known mechanism adopted in plant and animal systems. However, the decoding of such remarkable signatures is an uphill task and is always an interesting goal for the scientific community. In the past few decades, studies on the concentration and dynamics of intracellular  $\text{Ca}^{2+}$  are significantly increasing and have become a trend in modern biology. The advancement in approaches from  $\text{Ca}^{2+}$  binding dyes to *in vivo*  $\text{Ca}^{2+}$  imaging through the use of  $\text{Ca}^{2+}$  biosensors to achieve spatio-temporal resolution in micro and millisecond range, provide us phenomenal opportunities to study live cell  $\text{Ca}^{2+}$  imaging or dynamics. Here, we describe the usage, improvement and advancement of  $\text{Ca}^{2+}$  based dyes, genetically encoded probes and sensors to achieve extraordinary  $\text{Ca}^{2+}$  imaging in plants and animals.
