

A. Surface Features of the Heart

The heart is about the size of a fist and lies in the thoracic cavity within the **mediastinum** (*mediastineus* = midway), an area bounded by the lungs laterally, the sternum anteriorly, and the thoracic vertebrae posteriorly. The **base** of the heart is the wide superior portion of the heart from which the great vessels emerge, and the **apex** of the heart is the inferior pointed end. The base faces the right shoulder and the apex points to the left hip. The apex of the heart is located in the 5th intercostal space.

Like all mammalian hearts, the human heart has four chambers and is divided into right and left sides. Each side has an upper chamber called an **atrium** and a lower chamber called a **ventricle**. The two atria form the base of the heart, and the tip of the left ventricle forms the apex. **Auricles** (*auricle* = little ear) are pouch-like extensions of the atria. From the exterior, the auricles look like flaps with wrinkled edges.

Coronary blood vessels and adipose tissue are found in the **sulci** or grooves that externally mark the boundaries between the four heart chambers. Although a considerable amount of external adipose tissue is present on the heart surface for protection and padding, most heart models do not show this. The **coronary sulcus** is a deep sulcus that

externally shows the separation of the atria and the ventricles. The **anterior interventricular sulcus** and the **posterior interventricular sulcus** are shallow grooves that depict the surface boundaries between the two ventricles.
