

Particle Interactions:

What does a single force tell us as an object, it changes the momentum (velocity/energy) of an object.
Force = velocity
 and how many two objects they exert equal and opposite forces on each other.
 - transferred between the objects by their forces, if an other force act on them.

Force in Fundamental Interactions

and **Atoms** do not matter - change attractive
 binds the nucleus together - also known as strong nuclear force (strong interaction, short range)
 responsible for the radioactive decay of atoms (short range)
 neutrino: a type of physical interaction between elementary charged particles (electromagnetic/repulsive)

quarks force (attraction and repulsion) known!
 quarks associated that electromagnetic force arise due to the exchange of **virtual photons**

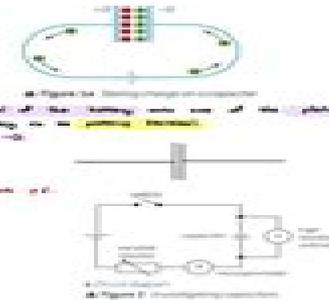

The closest thing a ball to not other means than to equal, as the ball transfers momentum from the
 to another, the people represent momentum particles that the ball represents as **exchange particles**
 The ball's throwing a ball to not other than that, to attract again, the people represent
 charged particles and the balling represents as "exchange particles".

Virtual force
 before, the strong nuclear force holds the neutrons and protons in a nucleus together, but it
 is not a **force** to change into a particle in γ decay or a **particle** to change into a neutron in β^+ decay
 or a neutron into a proton in β^- decay, or a **particle** to change into a neutron in β^+ decay
 but the force is not the thing that change particles.
 the nuclear force is also not the cause for beta decay as it involves particles other than
 the electron and neutrino.
 the cause is a different force at work every time particle change is beta decay

Capacitance

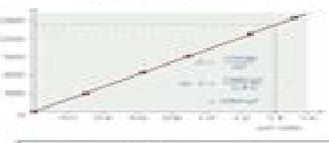

capacitor is a device designed to store charge
 could store electric potential energy when two capacitor
 are plate are in equal and opposite charge!
 the more charge the battery put on each plate the more potential of the battery use out of the plate
 the more of electrons from the other plate to come to its surface to be **positive charges**
 the more charge they get and the other capacitor store charge \rightarrow

capacitance of a capacitor is defined as the charge stored per volt of
capacitance

$$C = \frac{Q}{V}$$
 where Q is charge stored in capacitor and V is potential difference across it.
 Capacitor in a circuit
 Figure 1: Capacitance
 Figure 2: Capacitance

capacitor for storage of charge with two plates is a parallel
 the electric charges in the same direction
 in parallel and series circuits using an identical capacitor
 charge with $10 \mu C$
 about 10 is proportional to the $10 \mu C$
 and in a charged capacitor
 the electric charges in the same direction
 charge flow is a capacitor

the total area of all the plates and value of the other plate
 energy is stored in the region of **electric potential**

$$V = \frac{Q}{C} \quad C = \frac{QV}{V} = \frac{Q}{V}$$
 in this order graph

$$E = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{1}{2} \frac{Q^2}{C}$$
 in the charging process, the battery transfer **ENERGY** to the capacitor
 - 50% of energy stored by battery 1.0×10^{-4} is stored in capacitor
 - the other 50% is transfer to the **resistor in circuit**

Superposition

- **Superposition** occur when 2 or more waves pass through each other.
 - At the point where the waves meet, they continue to go on but before they meet apart.
 - The principle of superposition states that, for waves meet, the total displacement of
 point is equal to the sum of individual displacements at that point.

Constructive Interference
 - when a crest meets a crest, a **supercrest** is created - the waves **reinforce** each other
 - when a trough meets a trough, a **supertrough** is created - the waves **reinforce** each other

Destructive Interference
 - when a crest meets a trough of the **same amplitude**, the resultant displacement is zero as
 the waves travel past each other. This is called **total destructive interference**.
 - If they are not the same amplitude, the resultant displacement is called a **minimax**.

Examples of Superposition

1. **Stationary waves on a rope**
 - **Stationary waves** are formed on a rope if two people send waves continuously along a rope
 from either end.
 - The two ends of **progressive waves** combine to form waves along the rope.
 - At each node, the two ends of waves are **180° out of phase**, so they cancel each other out.

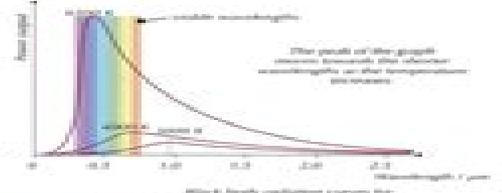

2. **Water waves in a ripple tank**
 - A reflecting dipper on a water surface sends out circular waves.
 - Points of **constructive** are created when 2 waves meet in phase.
 - These points create gaps in the wavefronts.
 - Points of **destructive** are created when a crest meets a trough.

The Discovery of Photoelectricity

1. The classical wave theory and two-body interaction.
 2. Planck's interpretation in terms of quanta.
 3. The theory of quantum wave being in better agreement in photoelectricity.
 4. Planck's explanation of photoelectricity and its significance in terms of the nature of the matter.

The Ultraviolet Catastrophe
 - It meant that as the temperature of the black body increases, the radiation emitted by it increases in all wavelengths.
 - A black body is a body that absorbs all the radiation of all wavelengths and re-emits all wavelength of the radiation.
 - Black body radiation is the maximum spectrum of the radiation emitted by a black body.

Wien's Displacement Law and Stefan's Law

$$P = \sigma A T^4$$

$$P = \sigma A \left(\frac{\lambda}{\lambda_0}\right)^4$$

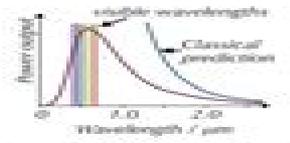

$$P \propto \frac{1}{\lambda^4}$$

Black body radiation curves for black bodies at 3000 K, 4000 K and 5000 K.

Why these three could not explain photoelectric phenomena
 - Classical wave theory suggested that $P \propto \frac{1}{\lambda^4}$ but power would
 not be present in least amount falling in UV region.

Planck's Interpretation of Light

- Max Planck suggested that the energy can only be released
 in discrete packets, or quanta - **Planck law**
 - Discrete instead of the waves could be discrete packets, photon,
 but photon law $E = hf$, quanta-the interaction with an electron
 in a metal surface.
Figure 2: The classical wave theory prediction (blue line) tends to infinity in the ultraviolet region because it assumed that power is $\frac{1}{\lambda^4}$

How to Study Physics? Peter Tan, 2014-04-30 Physics is hard to learn If you are you are not alone I had been in your shoes before and experienced the same It took me a hard time to find out what s wrong with my study method for Physics Subsequently I overcame the difficulties and scored in the subject Physics is not a subject that you could effectively learn by memorising the theories by hard and practising repetitively It s all about understanding and relating the concepts to the real world sometimes you can get by mathematics and chemistry by not relating the theories and concepts to the real world right The best thing about Physics is that once you know the correct study techniques it could become the easiest subject for you
