**Protein-polymer Conjugates Via Graft-from Ring-opening Metathesis Polymerization** Sergey A. Isarov, 2015 Protein therapeutics and biopharmaceuticals are used in a wide variety of clinical applications such as drug delivery and diagnostics Unfortunately protein based therapies possess significant limitations as a result of degradative processes that restrict the lifetime of proteins in vivo This project explores the growth of conformationally rigid polymers derived via graft from ring opening metathesis polymerization ROMP directly from the surface of proteins We predict that these polymers can protect proteins from degradation while bearing useful functionalities to improve their utility and behavior within biological systems We report a novel aqueous ROMP technique for the growth of polymers from the surface of lysozyme This technique represents the first example of the use of ROMP for the growth of polymers directly from the surface of a biological substrate under physiological conditions Via extensive proof of concept studies we report the successful formation of a protein ROMP macroinitiator that subsequently facilitated graft from ROMP to afford protein polymer conjugates of high molecular weights Further optimization of reaction conditions will be performed in order to more precisely control polymer length composition and polymerization kinetics Future studies will investigate ROMP from the surface of tobacco mosaic virus TMV to form high aspect ratio nanoparticle conjugates

**Synthesis of Poly(ethylene Glycol) Derivatives for Bioconjugation and Surface Patterning** En-Wei Lin, 2014 Poly ethylene glycol PEG is a biocompatible and water soluble polymer that has a wide range of applications in chemistry biology and medicine In this dissertation we describe the synthesis of end functionalized PEG derivatives and PEG like polymers for biomolecule conjugation and surface patterning applications In Chapter 1 we provide an overview on PEG protein conjugates as well as current synthetic approaches and applications for protein polymer conjugates and oligonucleotide polymer conjugates PEG protein conjugates are currently the only FDA approved protein polymer conjugates and the conjugation method plays an important role in protein performance In Chapter 2 we describe a site specific and photoinduced bioconjugation method utilizing non covalent protein ligand binding affinity and a photo reactive benzophenone group In control experiments such as without the benzophenone group or

without photo irradiation no PEG conjugation was observed by gel electrophoresis Some deficiencies of PEG such as immunological responses have been observed Moreover PEG does not significantly stabilize proteins in storage conditions or when stressed by heat and other factors In Chapter 3 we describe a new type of glycopolymer with trehalose side chains and showed its stabilizing effect toward several enzymes after heating or lyophilization In Chapter 4 we describe the conjugation of these trehalose polymers to small interfering ribonucleic acid siRNA and the investigation of their properties towards nuclease resistance and serum stability Previously we discovered that conjugation of comb type PEG oligo ethylene glycol methacrylate based polymers to siRNA enhanced its nuclease resistance and gene silencing efficiency In Chapter 5 we describe the preparation of similar siRNA polymer conjugates using the grafting from approach meaning that polymer growth occurred from a siRNA macroinitiator Additionally methacrylate based polymers with oligo ethylene glycol side chains have also been found to be tunable thermoresponsive polymers In Chapter 6 we describe the use of atom transfer radical polymerization ATRP to synthesize three distinctly temperature responsive oligo ethylene glycol methacrylate based polymers and the preparation of thermoresponsive and fluorescent hydrogel patterns Above their volume phase transition temperature VPTT the hydrogels collapsed due to the release of water and led to fluorescent quenching Multicomponent morphing surfaces were prepared to display dual color patterns and encrypted messages at different temperatures
