## **Performance Based Seismic Design Rising:**

*Performance Based Seismic Design for Tall Buildings* Ramin Golesorkhi, Leonard Joseph, Ron Klemencic, David Shook, John Viise, 2017-10-30 Performance Based Seismic Design (PBSD) is a structural design methodology that has become more common in urban centers around the world particularly for the design of high rise buildings. The primary benefit of PBSD is that it substantiates exceptions to prescribed code requirements such as height limits applied to specific structural systems and allows project teams to demonstrate higher performance levels for structures during a seismic event. However, the methodology also involves significantly more effort in the analysis and design stages with verification of building performance required at multiple seismic demand levels using Nonlinear Response History Analysis (NRHA). The design process also requires substantial knowledge of overall building performance and analytical modeling in order to proportion and detail structural systems to meet specific performance objectives. This CTBUH Technical Guide provides structural engineers, developers, and contractors with a general understanding of the PBSD process by presenting case studies that demonstrate the issues commonly encountered when using the methodology along with their corresponding solutions. The guide also provides references to the latest industry guidelines as applied in the western United States with the goal of disseminating these methods to an international audience for the advancement and expansion of PBSD principles worldwide.

High-Rise Buildings under Multi-Hazard Environment Mingfeng Huang, 2016-08-15 This book discusses performance based seismic and wind resistant design for high rise building structures with a particular focus on establishing an integrated approach for performance based wind engineering which is currently less advanced than seismic engineering. This book also provides a state of the art review of numerous methodologies including computational fluid dynamics (CFD), extreme value analysis, structural optimization, vibration control, pushover analysis, response spectrum analysis, modal parameter identification for the assessment of the wind resistant and seismic performance of tall buildings in the design stage and actual tall buildings in use. Several new structural optimization methods including the augmented optimality criteria method have been developed and employed in the context of performance based design. This book is a valuable resource for students, researchers, and engineers in the field of civil and structural engineering.

*Probabilistic performance-based seismic design* fib Fédération internationale du béton, 2012-05-07 In the last ten to fifteen years a vast amount of research has been undertaken to improve on earlier methods for analysing the seismic reliability of structures These efforts focused on identifying aspects of prominent relevance and disregarding the inessential ones with the goal of producing methods that are both more efficient and easier to use in practice Today this goal can be said to be substantially achieved During these years scientific activity covered all of the many aspects involved in such a multi disciplinary problem ranging from seismology to geotechnics to structural analysis and economy all of them to be consistently organised into a probabilistic framework As the output of this research was dispersed into a multitude of technical papers fib Commission 7 thought it worthwhile to select the essential aspects of this large body of knowledge and to present them into a coherent and accessible document for structural engineers To this end a task group of specialists was formed whose qualifications come from their personal involvement in the above mentioned developments throughout this period of time From its inception the group decided that the bulletin should have had a distinct educational character and provide a clear overview of the methods available The outcome is a compact volume that starts by introducing the concepts and definitions of performance based engineering continues with two chapters on assessment and design respectively presenting the methods in detail accompanied by illustrative examples and concludes with an appendix with sample programming excerpts for their implementation It is believed that at present fib Bulletin 68 represents a unique compendium on probabilistic performance based seismic design

*Seismic Isolation, Structural Health Monitoring, and Performance Based Seismic Design in Earthquake Engineering* Azer A. Kasimzade, Erdal Şafak, Carlos E. Ventura, Farzad Naeim, Yoichi Mukai, 2018-08-13 This book features chapters based on selected presentations from the International Congress on Advanced Earthquake Resistance of Structures AERS2016 held in Samsun Turkey from 24 to 28 October 2016 It covers the latest advances in three widely popular research areas in Earthquake Engineering Performance Based Seismic Design Seismic Isolation Systems and Structural Health Monitoring The book shows the vulnerability of high rise and seismically isolated buildings to long periods of strong ground motions and proposes new passive and semi active structural seismic isolation systems to protect against such effects These systems are validated through real time hybrid tests on shaking tables Structural health monitoring systems provide rapid assessment of structural safety after an earthquake and allow preventive measures to be taken such as shutting down the elevators and gas lines before damage occurs Using the vibration data from instrumented tall buildings the book demonstrates that large distant earthquakes and surface waves which are not accounted for in most attenuation equations can cause long duration shaking and damage in tall buildings The overview of the current performance based design methodologies includes discussions on the design of tall buildings and the reasons common prescriptive code provisions are not sufficient to address the requirements of tall building design In addition the book explains the modelling and acceptance criteria associated with various performance based design guidelines and discusses issues such as selection and scaling of ground motion records soil foundation structure interaction and seismic instrumentation and peer review needs The book is of interest to a wide range of professionals in earthquake engineering including designers researchers and graduate students
