
Embryology Practice Questions with Answers

1. The part of the sperm containing proteolytic enzymes to digest the zona pellucida is the:

- A. capacitor
- B. head
- C. corona
- D. acrosome
- E. cumulus - D. is correct.

The acrosome is the part of the sperm containing proteolytic enzymes to digest the zona pellucida. It is exposed by the process of capacitation. Then, under the influence of substances released by corona radiata cells, it releases its proteolytic enzymes and penetrates the oocyte.

2. The ovulated mammalian oocyte is arrested at:

- A. prophase of meiosis I
- B. metaphase of meiosis I
- C. prophase of meiosis II
- D. metaphase of meiosis II
- E. none of the above - D. is correct.

The long arrest in meiosis occurs in the primary oocyte. These descendants of oogonia begin meiosis before birth and stop dividing during prophase of the first division. Years later, this first division is completed just prior to ovulation. Ovulated secondary oocytes then stop at metaphase II until fertilized.

3. The seven-day blastocyst:

- A. has a single layer of trophoblast at the embryonic pole
- B. has an amniotic cavity
- C. is attached to the endometrial epithelium
- D. is surrounded by a degenerating zona pellucida
- E. is called the hypoblast - C. is correct.

The decidual reaction of the endometrium creates a nourishing environment for the conceptus as it buries itself by invasion of the uterine endometrial wall. Progesterone produced by the corpus luteum stimulates glandular secretion in the endometrium during the secretory phase of menstruation or early pregnancy.

4. Haploid nuclei that fuse at fertilization are called:

- A. homunculi
- B. mitotic figures
- C. centrioles
- D. nucleoli
- E. pronuclei - E. is correct.

Embryology Practice Exam Questions Seethesolutions
