Sala-Lizarraga,Ana Picallo-Perez,2019-10-01 Quantifying exergy losses in the energy supply system of buildings reveals the potential for energy improvement which cannot be discovered using conventional energy analysis Thermoconomics combines economic and thermodynamic analysis by applying the concept of cost an economic concept to exergy as exergy is a thermodynamic property fit for this purpose in that it combines the quantity of energy with its quality factor Exergy Analysis and Thermoconomics of Buildings applies exergy analysis methods and thermoconomics to the built environment The mechanisms of heat transfer throughout the envelope of buildings are analyzed from an exergy perspective and then to the building thermal installations analyzing the different components such as condensing boilers absorption refrigerators microgeneration plants etc including solar installations and finally the thermal facilities as a whole A detailed analysis of the cost formation process is presented which has its physical roots firmly planted in the second law of thermodynamics The basic principles and the rules of cost allocation in energy units exergy cost in monetary units exergoeconomic cost and in CO2 emissions exergoenvironmental cost based on the so called Exergy Cost Theory are presented and applied to thermal installations of buildings Clear and rigorous in its exposition Exergy Analysis and Thermoconomics of Buildings discusses exergy analysis and thermoconomics and the role they could play in the analysis and design of building components either the envelope or the thermal facilities as well as the diagnosis of thermal installations This book moves progressively from introducing the basic concepts to applying them Exergy Analysis and Thermoconomics of Buildings provides examples of specific cases throughout this book These cases include real data so that the results obtained are useful to interpret the inefficiencies and losses that truly occur in actual installations hence the assessment of their effects encourages the manner to improve efficiency Applies exergy analysis methods for the installation of building thermal facilities equipment components including pipes valves heat exchangers boilers and heat pumps Helps readers determine the operational costs of heating and cooling building systems Includes exergy analysis methods that are devoted to absorption refrigerators adsorption cooling systems basic air conditioning processes ventilation systems and solar systems either thermal and PV Discusses the direct application of exergy analysis concepts including examples of buildings with typical heating DHW and air conditioning installations

**Life Cycle Costing Techniques Applicable to Law Enforcement Facilities** Robert J.

Kapsch,1974 Planners architects engineers and others engaged in the planning design and construction of law enforcement facilities are charged with a number of decisions that will affect future resource allocations by the agency operating the constructed facility Such future resource allocations would include the agency s being required to provide more or fewer personnel to operate the facility to provide more or less frequent replacement of the component parts of the facility and to provide more or less supplies to operate the facility Decision makers should be sensitive to the economic impact of their decisions projected over the life of the facility The analytical tool presented in this paper for the evaluation of the economic

impact of various design alternatives is the technique of life cycle costing Through the use of this technique the life cycle allocations by an agency for a law enforcement facility can be minimized
