Email Forensics Crow Security, 2022-04-20 Email Communication first evolved in the 1960s and since then emails are being used as the primary communication mode in enterprises for business communication Today a mass number of internet users are dependent on emails to receive information and deals from their service providers The growing dependence on email for daily communication given raise to email crimes Cybercriminals are now using email to target innocent users to lure them with attractive deals via spam emails Therefore forensic investigators need to have a thorough understanding of an email system and different techniques used by cyber criminals to conduct email crimes Email forensics refers to the study of the source and content of emails as evidence to spot the actual sender and recipient of a message data time and intent of the sender In this module of the computer forensics investigation series we will learn various steps involved in the investigation of email crime We will learn to investigate the meta data of malicious emails You will understand port scanning keyword searching and analysis of headers in emails Here

the primary goal for a forensics investigator is to find the person behind the email crime Hence he has to investigate the server of the email network devices software and fingerprints of the sender mailer Further we will understand various components involved in email communication We will learn about mail user agents mail transfer agents and various protocols used to send emails As we know an email system works on the basic client server architecture that allows clients to send and receive emails An email client software helps the sender to compose the mail Most of them have a text editor which helps the sender to compose the email for the receiver Here while composing emails malicious people embed malicious scripts and attach malware and viruses which are then sent to people The goal of this ebook is not to help you set up an email server rather we will focus on understanding the basic functionality of the email server We will understand what components an email system consists of which allows users to send and receive emails Furthermore we will dive deeper into the forensics part to investigate and discover evidence We will understand the investigation procedure for email crimes

Investigating and Implementing an Email Forensic Readiness Architecture Franscois Ruan Van Staden,2017 Email forensic investigations rely on the collection and analysis of digital forensic evidence collected from email systems Problems arise when the digital forensic evidence needed for the email forensic investigation is no longer available or there is a huge amount of email data that can be collected which take time to sift through to find the digital forensic evidence that is actually needed The email digital forensic readiness eDFR architecture as proposed in this dissertation endeavours to address these problems The eDFR architecture is based on the digital forensic readiness process described in ISO 27043 To ensure that the collected email data can be used as digital forensic evidence a process to validate the collected email data was created The validation process uses data collected from the email IP headers to validate the data in the SMTP headers ensuring that the SMTP header data was not spoofed or in any way changed The IP header data is stored in an audit database together with the email data so that the validation process can be executed at any time An audit database is used to store the collected data to ensure that once the data is stored it cannot be tampered with The digital forensic evidence collected using the eDFR architecture was found to be useable as part of an email forensic investigation It was also found to be useful for other processes such as creating a graph representation of email sent and received by an email system or a group of email systems It was shown that implementing the eDFR architecture could be achieved in an economical way that has almost no impact on current email systems

Jasbinder Singh Bali,2007 ABSTRACT Phishing scams which use emails to trick users into revealing personal data have become pandemic in the world Analyzing such emails to extract maximum information about them and make intelligent forensic decisions based on such an analysis is a major task for law enforcement agencies To date such analysis is done by manually checking various headers of a raw email and running various Unix tools on its constituent parts such as IP addresses links domain names This thesis describes the design and development of a database system used for automation of a system called the Undercover Multipurpose Anti Spoofing Kit UnMASK that will enable investigators to reduce the time and effort needed for digital forensic investigations of email based crimes It also describes how the database is used to perform such automation UnMASK uses a database for organizing a work flow to automatically launch Unix tools to collect additional information from the Internet The retrieved information is in turn added to the database UnMASK is a working system To the best of our knowledge UnMASK is the first comprehensive system that can automate the process of analyzing emails using a database and then generate forensic reports that can be used for subsequent investigation and prosecution

Paglierani,2013 The digital forensics community has neglected email forensics as a process despite the fact that email remains an important tool in the commission of crime Current forensic practices focus mostly on that of disk forensics while email forensics is left as an analysis task stemming from that practice As there is no well defined process to be used for email forensics the comprehensiveness extensibility of tools uniformity of evidence usefulness in collaborative distributed environments and consistency of investigations are hindered At present there exists little support for discovering acquiring and representing web based email despite its widespread use To remedy this a systematic process which includes discovering acquiring and representing web based email for email forensics which is integrated into the normal forensic analysis workflow and which accommodates the distinct characteristics of email evidence

will be presented This process focuses on detecting the presence of non obvious artifacts related to email accounts retrieving the data from the service provider and representing email in a well structured format based on existing standards As a result developers and organizations can collaboratively create and use analysis tools that can analyze email evidence from any source in the same fashion and the examiner can access additional data relevant to their forensic cases Following an extensible framework implementing this novel process driven approach has been implemented in an attempt to address the problems of comprehensiveness extensibility uniformity collaboration distribution and consistency within forensic investigations involving email evidence

Deconstruction and Analysis of Email Messages Zhenghui Zhu,2007 It addresses the following problems how can we parse a raw email message and find the information for investigation What kind of information can we gather from the Internet And which UNIX tools can be used for our investigation In contrast to other work in this area this research comprehensively considers exploits in phishing emails and defines a well provided raw email parser for law enforcement investigations And we also design and implement a new protocol used in the UNIX tool system It not only tries to identify suspicious emails but also emphasizes the gathering of evidence of crime To the best of our knowledge UnMASK is the first system that can automatically deconstruct email messages and present related forensic information in a convenient format to law enforcement Test results show that the parser and the UNIX tool system of UnMASK are stable and useful It can correctly extract information that law enforcement officers want to check in raw emails and it also correctly gathers information from the Internet It generally takes a couple of minutes for our system to complete the report for one raw email message Compared to the hours investigators spent to do the same work our system greatly improves their efficiency
