## Grid-In Questions

### Transmission Genetics Edition

In snapdragons (*Antirrhinum*), the phenotype for flower color is governed by two alleles – red (R) and white (W). Heterozygous individuals have pink flowers. Two pink individuals are crossed to produce 465 offspring.

1. Calculate how many of these offspring are expected to have the red phenotype. Round your response to the nearest whole number.

In corn (*Zea mays*), purple kernels (R) are dominant to yellow kernels (r). Cobs from the offspring of a cross between a purple plant and yellow plant were used in a lab. A student counts 329 purple and 299 yellow kernels on one cob.

2. Calculate the chi-squared value for the null hypothesis that the purple parent was heterozygous for purple kernels. Give your answer to the nearest tenth.

In a dog breed known as the Mexican Hairless, the “hairless” phenotype is a result of a mutation displaying an autosomal dominant pattern of inheritance. Homozygous recessive individuals (hh) display a “coated” phenotype. Inheriting two copies of the mutation (HH) is lethal during embryonic development.

3. In a cross between two dogs with the hairless phenotype, what proportion of puppies born is expected to be hairless? Give your answer in the form of a fraction.

Wild-type fruit flies have red eyes (+). The “white-eyed” phenotype (w) is recessive and results from a mutation on the X chromosome. During a lab, students cross a white-eyed male with a homozygous red-eyed female. A red-eyed female and a red-eyed male from the F1 generation are then bred to produce 573 offspring.

4. How many of the offspring are predicted to be white-eyed males? Round your response to the nearest whole number.

A plant geneticist is investigating the inheritance of genes for bitter taste (Su) and explosive rind (e) in watermelon (*Citrullus lanatus*). Explosive rind is recessive and causes watermelons to burst when cut. Non-bitter watermelons are a result of the recessive genotype (susu). The geneticist wishes to determine if the genes assort independently. She performs a testcross between a bitter/non-explosive hybrid and a plant homozygous recessive for both traits. The following offspring are produced:

bitter/non-explosive – 88  
bitter/explosive – 68  
non-bitter/non-explosive – 62  
non-bitter/explosive – 81

5. Calculate the chi-squared value for the null hypothesis that the two genes assort independently. Give your answer to the nearest tenth.
