*State-of-the-art fiber simulation and ply modeling, with property verification, results utilities and direct integration with the Layup Pipeline*

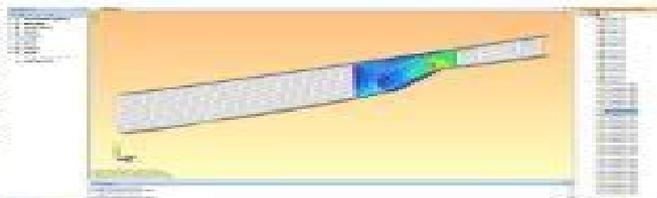

## for Femap

**Composites Modeler for Femap (CMF)** provides proven fiber simulation capabilities and advanced ply-based model building — all seamlessly integrated within Femap. Analysis properties are generated and verified efficiently. Layered results can be calculated and browsed. Finally, complete integration with Simulayt's Layup Pipeline allows direct linkage with Design and Manufacture functions.

The fiber simulation ensures that unmanufacturable plies cannot be specified, right at the beginning of the process. This avoids costly re-engineering late in the development cycle. Manufacturing data is generated to ensure that the final part matches the analysis model.

Now, continuously-varying fiber orientations and ply thicknesses can be fed directly to solvers for detailed analysis. The resultant orientation of plies on each element faithfully reflects the simulated and actual fiber architecture. This ensures simulations of unprecedented fidelity. Analysis results can be sorted by global ply for realistic interpretation, and failure loads determined.

### CAPABILITIES

- State-of-the-art fiber simulation, proven since 1992.
- Efficient ply-based layup modeling to reflect manufacture and allow rapid modification.
- Automated analysis property generation and verification.
- Efficient results visualisation, sorting by global ply, and calculation of failure.
- Direct integration with the Layup Pipeline for seamless communication across the enterprise.

### BENEFITS

- Prevents specification of plies and structures that cannot be manufactured, avoiding costly mistakes.
- Improves model fidelity and reduces setup time to allow rapid design improvement.
- Allows seamless analysis, design and manufacture integration across the enterprise to promote development efficiency.

### PREREQUISITES

**Advances in Modeling and Simulation in Textile Engineering** Nicholus Tayari Akankwasa, Dieter Veit, 2021-03-28 *Advances in Modeling and Simulation in Textile Engineering: New Concepts, Methods and Applications* explains the advanced principles and techniques that can be used to solve textile engineering problems using numerical modeling and simulation. The book draws on innovative research and industry practice to explain methods for the modeling of all of these processes, helping readers apply computational power to more areas of textile engineering. Experimental results are presented and linked closely to processes and methods of implementation. Diverse concepts such as heat transfer, fluid dynamics, three-dimensional motion, and multi-phase flow are addressed. Finally, tools, theoretical principles, and numerical models are extensively covered. Textile engineering involves complex processes which are not easily expressed numerically or simulated, such as fiber motion simulation, yarn-to-fiber formation, melt spinning technology optimization, yarn production, textile machinery design and optimization, and modeling of textile fabric reinforcements. Provides new approaches and techniques to simulate a wide range of textile processes from geometry to manufacturing. Includes coverage of detailed mathematical methods for textiles, including neural networks, genetic algorithms, and the finite element method. Addresses modeling techniques for many different phenomena, including heat transfer, fluid dynamics, and multi-phase flow.

**Advanced Composite Materials** Wen Zhe Chen, Xing Jun Liu, Pin Qiang Dai, Yong Lu Chen, Zheng Yi Jiang, 2012-02-27. Selected peer-reviewed papers from the 3rd international Conference on Manufacturing Science and Engineering (ICMSE 2012), March 27-29, 2012, Xiamen, China.

Mechcomp3 Antonio J.M. Ferreira, Erasmo Viola, Francesco Tornabene, Nicholas Fantuzzi, 2017-05-25. The use of composite materials has grown exponentially in the last decades and has affected many engineering fields due to their enhanced mechanical properties and improved features with respect to conventional materials. For instance, they are employed in civil engineering (seismic isolators, long span bridges, vaults), mechanical engineering (turbines, machine components), aerospace and naval engineering (fuselages, boat hulls, and sails), automotive engineering (car bodies, tires), and biomechanical engineering (prostheses). Nevertheless, the greater use of composites requires a rapid progress in gaining the needed knowledge to design and manufacture composite structures. Thus, researchers and designers devote their own efforts to develop new analysis techniques, design methodologies, manufacturing procedures, micromechanics approaches, theoretical models, and numerical methods. For these purposes, it is extremely easy to find many recent journal papers, books, and technical notes focused on the mechanics of composites. In particular, several studies are presented to take advantage of their superior features by varying some typical structural parameters such as geometry, fiber orientations, volume fraction, structural stiffness, weight, lamination scheme. Therefore, this Conference aims to collect contributions from every part of the globe that can increase the knowledge of composite materials and their applications by engaging researchers and professional engineers and designers from different sectors. The same aims and scopes have been reached by the previous editions of *Mechanics of*
