An Improved K-means Clustering Algorithm For Data Mining Neha Aggarwal, Kirti Aggarwal, 2012 Data clustering is an unsupervised classification method aims at creating groups of objects or clusters in such a way that objects in the same cluster are very similar and objects in different clusters are quite distinct K means is an iterative algorithm in which the number of clusters must be determined before the execution In this book an efficient k means algorithm is proposed Since in each iteration the k means algorithm computes the distances between data point and all centers this is computationally very

expensive especially for huge data sets For each data point we can keep the distance to the nearest cluster At the next iteration we compute the distance to the previous nearest cluster If the new distance is less than or equal to the previous distance the point stays in its cluster and there is no need to compute its distances to the other cluster centers This saves the time required to compute distances to $k - 1$ clusters Experimental results show the accuracy and effectiveness of the proposed method
