The 8051/8052 Microcontroller Craig Steiner, 2005 This book was written with the novice or intermediate 8052 developer in mind Assuming no prior knowledge of the 8052 it takes the reader step by step through the architecture including discussions and explanations of concepts such as internal RAM external RAM Special Function Registers SFRs addressing modes timers serial I O and interrupts This is followed by an in depth section on assembly language which explains each instruction in the 8052 instruction set as well as related concepts such as assembly language syntax expressions assembly language directives and how to implement 16 bit mathematical functions The book continues with a thorough explanation of the 8052 hardware itself reviewing the function of each pin on the microcontroller and follows this

with the design and explanation of a fully functional single board computer every section of the schematic design is explained in detail to provide the reader with a full understanding of how everything is connected and why The book closes with a section on hardware interfacing and software examples in which the reader will learn about the SBCMON monitor program for use on the single board computer interfacing with a 4x4 keypad communicating with a 16x2 LCD in direct connect as well as memory mapped fashion utilizing an external serial EEPROM via the SPI protocol and using the I2C communication standard to access an external real time clock The book takes the reader with absolutely no knowledge of the 8052 and provides him with the information necessary to understand the architecture design and build a functioning circuit based on the 8052 and write software to operate the 8052 in assembly language [Some Assembly Required](#) Timothy S Margush,2016-04-19 A family of internationally popular microcontrollers the Atmel AVR microcontroller series is a low cost hardware development platform suitable for an educational environment Until now no text focused on the assembly language programming of these microcontrollers Through detailed coverage of assembly language programming principles and technique [Embedded Systems Design using the MSP430FR2355 LaunchPad™](#) Brock J. Smith,2021 [Arduino and EForth](#) Chen-Hanson Ting,2018-11-08 All these years I have been looking for microcontroller platforms on which I can teach people how to program in the FORTH language I designed a training course I called Firmware Engineering Workshop I could train an open minded engineer to program in FORTH in about a week with a reasonable capable platform i e a microcontroller evaluation board with a FORTH operating system loaded Good platforms are expansive and low cost

platforms are inadequate What I did was to grab any microcontroller board at hand and used it It did not work well because what I taught could not be easily replicated by people at home People got frustrated when they could not reproduce results I demonstrated Then I found the Arduino Uno Board The microcontroller evaluation board I need must have a microcontroller with reasonable capabilities An 8 bit microcontroller with a fast clock is adequate 16 bit or 32 bit microcontrollers are of course much better The board must have at least 8 KB of ROM memory and 1 KB of RAM memory It must also have a USART port to communicate with a terminal emulator on a host PC Any other I O devices will be icings on the cake The more the better Arduino Uno has all of the components I listed above It is also inexpensive costing only 29 It uses ATmega328P a very interesting microcontroller which has 32 KB of flash memory enough to host a FORTH operating system 2 KB of RAM and many I O devices to build substantial applications Arduino Uno also has a USB port which connects to a PC and an USART device in ATmega328P This serial interface is necessary for a FORTH system so that you can run and program ATmega328P interactively from a terminal emulator on the PC as the complete Forth is on the chip Arduino Uno is a lovely machine You connect it through a USB cable to your PC and you can program it to do many interesting things Its microcontroller ATmega328P running at 16 MHz is very capable of running many interesting applications The template of a sketch which is the software in Arduino 0022 captures the essence of firmware programming in casting user applications in two statements setup and loop It eliminates all the syntactic statements required by a normal C program and exposes to you only the core of an application However Arduino software insulates you from the intricate nature of ATmega328P microcontroller its instruction set and its I O devices Instead you are given a library of useful routines which are used to build applications The insulation initially helps you to program the microcontroller in a C like high level programming language However being an 8 bit microcontroller ATmega328P in C language will run out of gas when application demands performance At this point you will have to get down to the bare metal to push ATmega328P to its limit Then you have to learn its instruction set and all its I O devices and perhaps program it in assembly language The best alternative approach is to program ATmega328P in the FORTH language FORTH exposes ATmega328P to you You can interactively examine its RAM memory its flash memory and all the I O devices surrounding the CPU You can incrementally add small pieces of code and test them exhaustively An interactive programming and debugging environment greatly accelerates program development and ensures the quality of the program Since 1990 I have been promoting a simple FORTH language model called eForth This model consists of a kernel of 30 primitive FORTH commands which have to be implemented in machine instructions of a host microcontroller and 190 compound FORTH commands constructed from the primitive commands and other compound commands By isolating machine dependent commands from machine independent commands the eForth model can be easily ported to many different microcontrollers This model is ported to ATmega328P and the result is the 328eForth system
