Pose estimation by extended Kalman filter using noise covariance matrices based on sensor output

Ayuko SAITO^{1*}, Satoru KIZAWA², Yoshikazu KOBAYASHI² and Kazuto MIYAWAKI²

Abstract

This paper presents an extended Kalman filter for pose estimation using noise covariance matrices based on sensor output. Compact and lightweight nine-axis motion sensors are used for motion analysis in widely various fields such as medical welfare and sports. A nine-axis motion sensor includes a three-axis gyroscope, a three-axis accelerometer, and a three-axis magnetometer. Information obtained from the three sensors is useful for estimating joint angles using the Kalman filter. The extended Kalman filter is used widely for state estimation because it can estimate the status with a small computational load. However, determining the process and observation noise covariance matrices in the extended Kalman filter is complicated. The noise covariance matrices in the extended Kalman filter were found for this study based on the sensor output. Postural change appears in the gyroscope output because the rotational motion of the joints produces human movement. Therefore, the process noise covariance matrix was determined based on the gyroscope output. An observation noise covariance matrix was determined based on the accelerometer and magnetometer output because the two sensors' outputs were used as observation values. During a laboratory experiment, the lower limb joint angles of three participants were measured using an optical 3D motion analysis system and nine-axis motion sensors while participants were walking. The lower limb joint angles estimated using the extended Kalman filter with noise covariance matrices based on sensor output were generally consistent with results obtained from the optical 3D motion analysis system. Furthermore, the lower limb joint angles were measured using nine-axis motion sensors while participants were running in place for about 100 seconds. The experiment results demonstrated the effectiveness of the proposed method for human pose estimation.

gyroscope drift using information obtained from the other two sensors has been used for human pose estimation during daily activities and exercise [11-13]. Furthermore, a sensor fusion algorithm able to correct the magnetometer output using information obtained from a gyroscope has been used for pose estimation in a variable magnetic field [14,15]. The Kalman filter [16-20] and the complementary filter [21-25] are some pose estimation methods using sensor fusion.

The Kalman filter estimates the system state with a small computational load. Nevertheless, determining the process and observation noise covariance matrices in the Kalman filter is complicated. For a case in which the process and observation noise covariance matrices are time-invariant, the estimation accuracy might decrease if the sensor output noise increases. Moreover, the noise of the sensor output might vary because of long-term measurements. For that reason, adjusting the noise covariance matrices based on sensor output is important.
