

MATERIAL AND ENERGY BALANCES CALCULATION FOR CHEMICAL PROCESS

MODULE 3 PART 1 – Material and Energy Balances
ChE 45 – Chemical Engineering Design 1
Lapeña, Don Kim S.

INTRODUCTION

As pre-requisites of any material or energy balance calculation for a chemical process, we should already have:

- A complete **block flow plant diagram**
- Targeted **production rate** or available raw materials feed rate. Either is set as part of the basic design bases.

MATERIAL BALANCE

A material balance taken **over the complete process** will determine the quantities of raw materials required and products produced.

Balances over individual process units set the process stream flows and compositions:

How do we begin the MB calculation for our designed process? Refer to:

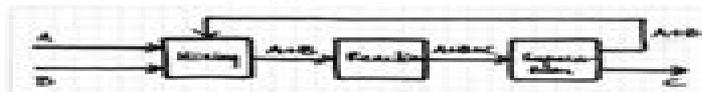

- The complete block flow plant diagram, and the
- Targeted production rate or available raw materials (RM) feed rate (either is set as part of the basic design bases).

Where do we start our calculation (calculation basis)?

- Production rate if RM/feedstock do not have supply restriction.
- RM feed if feedstock's have supply constraints which could be due to seasonality, inherent low supply, very high cost, difficult transportation, etc.

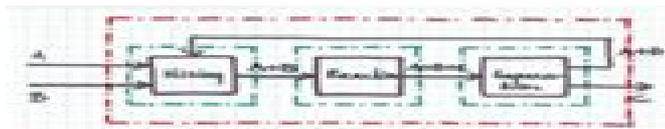

MATERIAL BALANCE REVIEW

In order to visualize the process, you can draw a simple **block flow diagram** that shows the material flows and the process steps. You can also give names (or numbers) to the flows and the process steps and write known or given data (inc. T, P, concentration, other relevant parameters) regarding the flows or the process conditions in the diagram.

We can also choose boundaries (ways to choose balance boundaries):

- An overall balance boundary around the entire process (including the recirculation)
- Balance boundaries around each process step (Mixing, Reaction, Separation)
- Partial mass balances for components A, B, or C using the same balance boundaries as in the first two choices.

Sometimes, you only need one balance to find out what you need while at other times you might need all these balances as well as additional information.

The additional information needed can be any of the following:

- Stoichiometry of the chemical reaction
- Limiting conditions for the reaction
- The extent of reaction or the reaction kinetics including heat effects
- The separation efficiency
- Recirculation ratio

The solution can be found by solving a **single equation** or by solving a **system of many equations** either algebraically or numerically.

The more we decide to be more detailed in our analysis, **the more complicated** will the solution process.

CONTINUOUS OR BATCH PROCESS CALCULATIONS

Continuous – We are more used to continuous process in our MB calculations. Generally, only algebraic linear equations will mathematically model this process.

Batch – required the estimation of processing times, among other requirements. Differential equations will be the usual mathematical model to be used.

emphasis is placed on multi device flowsheets with recycle bypass and purge streams whose material and heat balance equations were previously too complicated to solve by the normally used hand calculator The Excel based program FlowBal helps the user set up material and heat balance equations for processes with multiple streams and units Mass and Energy Balances in Materials Engineering Mark A.
