Abstract: The use of agricultural mechanization technologies is equally important in boosting agricultural outputs as that of other biological technologies. To realize this number of stakeholders was involved in doing research, multiplication, importing, disseminating technologies and other activities of extension service for farmers whether it is in organized manner or not. Considerable numbers of agricultural mechanization technology types were also introduced from research centers, importers (dealers), NGOs, and government bodies. However, adoption status and associated factors were not studied so far. Therefore, this research was initiated to assess adoption status of technologies and factors that affect the use and to draw some implications for policy, research, and development practitioners for further interventions. Descriptive and inferential statistics were used to summarize qualitative data and the socio-demographic data of the households and logistic regression model was employed to assess factors that determine adoption. Generally, technology utilization status was found to be very poor and different factors like age, education of households, landholding, family size and technology access were the main contributors for the low utilization. Furthermore, low attention given by government bodies was the most critical factor for mal functionality of different actors/ stakeholders in the area.

1. Introduction

The level, appropriate choice and subsequent proper use of mechanized inputs into agriculture has a direct and significant effect on achievable levels of land productivity, labor productivity, the profitability of farming, the sustainability, the environmental and, on the quality of life of people engaged in agricultural businesses. Therefore, the use of these mechanization technologies is essential and they are among the major inputs in agricultural businesses [1] and [2].

[3] Reported that unless the problem of farm power is given reliable solution and addressed practically in Sub-Saharan African Countries (SSA), the region is at risk of increasing poverty and hunger. Moreover, this report extended emphasizing on effect of farm mechanization that these SSA countries are unlikely unable to attain the Millennium Development Goal of halving the proportion of people suffering extreme poverty by 2015, and the similar goal of the World Food Summit in 1996 to reduce the number

of starving people by half. These and other research outputs and development practitioners' views clearly indicate the importance of agricultural mechanization technologies in increasing production and productivity and improving the livelihoods of the farmers.

There are considerable numbers of agricultural mechanization technologies that have been developed, modified and adopted by different mechanization research centers and imported by technology dealers. Most of these technologies were released by the research centers and the local multipliers are trained by those research centers to multiply the technologies. Mould bold plow, spike-tooth harrow, wheat-barley-teff thresher, maize Sheller, animal drawn carts, diffused light potato seed storage, edible potato storage and grain storage are some of the technologies that have been transferred to multipliers with their full design and production manuals [4]. On top of the formal transfer of these mechanization technologies, the private multipliers and importers (dealers) and different NGOs (like FAO who imported wheat-barley thresher and AGROW SAW seed cleaners for
