Describing the latest advances in the field, *Quantitative Risk Management* covers the methods for market, credit and operational risk modelling. It places standard industry approaches on a more formal footing and explores key concepts such as loss distributions, risk measures and risk aggregation and allocation principles. The book's methodology draws on diverse quantitative disciplines, from mathematical finance and statistics to econometrics and actuarial mathematics. Topics include modeling cash flows, net investment income versus net portfolio value, projections of interest rates and volatility. A guide for asset liability managers and other investment professionals who are faced with the decision of whether to build or buy a financial model to measure, monitor, and help manage their institution's risk exposure. It reviews the evolution of interest rate risk models and evaluates the state of the art models in use. Includes modeling cash flows, modeling the term structure, OAS technology, net interest income versus net portfolio value, build versus buy analysis, practical methods for deriving input assumptions, prepayment rates, deposit decay rates, projections of interest rate and volatility.

The Oxford Handbook of Credit Derivatives Alexander Lipton, Andrew Rennie, 2013-01-17 From the late 1990s the spectacular growth of a secondary market for credit through derivatives has been matched by the emergence of mathematical modelling analysing the credit risk embedded in these contracts. This book aims to provide a broad and deep overview of this modelling covering statistical analysis and techniques, modelling of default of both single and multiple entities, counterparty risk, Gaussian and non Gaussian modelling, and securitisation. Both reduced form and firm value models for the default of single entities are considered in detail with extensive discussion of both their theoretical underpinnings and practical usage in pricing and risk. For multiple entity modelling the now notorious Gaussian copula is discussed with analysis of its shortcomings as well as a wide range of alternative approaches including multivariate extensions to both firm value and reduced form models and continuous time Markov chains. One important case of multiple entities modelling counterparty risk in credit derivatives is further explored in

two dedicated chapters Alternative non Gaussian approaches to modelling are also discussed including extreme value theory and saddle point approximations to deal with tail risk Finally the recent growth in securitisation is covered including house price modelling and pricing models for asset backed CDOs The current credit crisis has brought modelling of the previously arcane credit markets into the public arena Lipton and Rennie with their excellent team of contributors provide a timely discussion of the mathematical modelling that underpins both credit derivatives and securitisation Though technical in nature the pros and cons of various approaches attempt to provide a balanced view of the role that mathematical modelling plays in the modern credit markets This book will appeal to students and researchers in statistics economics and finance as well as practitioners credit traders and quantitative analysts
