**Employ the maintenance practices outlined here to increase the cooling capacity of your air-cooled heat exchangers.**

Air-cooled heat exchangers (ACHEs), sometimes called air coolers, are used in refineries, petro-chemical plants, gas treating plants, compressor stations, power plants, and other facilities. ACHEs are used for process cooling and/or condensing. There are thousands of these exchangers in use today, cooling and/or condensing everything from engine jacket water to process steam to highly viscous tar.

Often, these processes are critical to the operation of the plant. An ACHE outage will trigger the plant to shut down or operate at reduced capacity, which may cause significant loss of revenue.

This article describes the operation of ACHEs and identifies critical components that could fail and reduce the cooling capacity. It also identifies maintenance practices and procedures that help increase heat exchange capability and reduce the probability of component failure.
