

Standard Test Method for Consolidated Drained Triaxial Compression Test for Soils¹

This standard is issued under the standard designation system and number immediately following the designation, followed the year of original adoption or, in the case of revision, the year of last approval. It appears in parentheses followed the year of last approval or, in parentheses, the year of withdrawal or revision of the standard.

1. Scope

1.1 This test method covers the determination of strength and stress-strain relationships of a cylindrical specimen of either intact or remolded soil. Specimens are consolidated and drained or consolidated with drainage at a constant rate of axial deformation. Certain exceptions.

1.2 This test method provides for the calculation of principal stresses and axial compression by measurement of axial load, axial deformation, and volume-change changes.

1.3 This test method provides data useful in determining strength and deformation properties such as Mohr strength envelopes. Generally, three specimens are tested at different effective consolidation stresses to define a strength envelope.

1.4 If this test method is used on cohesive soils, water may have to be kept to constant.

1.5 The determination of strength envelopes and the shear capacity of soils may be used in subsequent and existing test results are beyond the scope of this test method and must be performed by a qualified, experienced geotechnical engineer.

1.6 All values of soil parameters shall conform to the guidelines for significant digits and rounding established in Practice D5696.

1.6.1 The methods used to specify how data are collected, tabulated, or recorded in this standard are regarded as the industry standard. In addition, there are recommendations of the significant digits that generally should be retained. The user must not do any further essential variations, however, for obtaining the data, record systems should be set up and tested to ensure that data are beyond the scope of this test method to ensure significant digits used in analysis methods are engineering design.

1.7 Notes—The notes listed in 01 apply to be regarded as standard. The triaxial cells shall give to specimens for measurement measurements, which are provided for information purposes only and are not considered standard. Reporting of

test results in units other than SI shall not be regarded as non-conformance with this test method.

1.7.1 The instrumentation system of triaxial cell shall be used with care with each test series. In this system, the general cell operations a unit of force (weight), while the unit for stress is stress. The test cell is not given, unless drainage is in the instrument and constant.

1.7.2 It is common practice in the geotechnical engineering profession to temporarily use pounds as a unit of stress (force) and of force (stress). This practice involves two separate systems of units, that is, the absolute system and the gravitational system. It is internationally undesirable to combine the use of two separate sets of units, and this practice is strongly discouraged. As noted, this standard includes the gravitational system of units (pound force and stress) and the absolute system. However, the use of pounds as a unit of stress (force) is discouraged by recommending density in lb/ft^3 shall not be regarded as non-conformance with this standard.

1.7.3 The term density and unit weight are often used interchangeably. Density is mass per unit volume whereas unit weight is force per unit volume. In this standard density is given only in SI units. When the density has been determined, the unit weight is calculated by SI or triaxial cell, as both.

1.8 This standard may involve hazardous materials, operations, and equipment. This standard does not purport to address all of the safety concerns of any particular work site. It is the responsibility of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.
