### Practical 3

#### Modelling with Covariates: Case Studies and Examples

##### Logistic Regression

The data to be analysed in this part of the practical was taken from a literature review by Colditz et al. published in *JAMA* (1974) on the efficacy of the BCG vaccine in prevention of tuberculosis (TB). Data from 13 independent studies is available in Stata datafile `BCG_TB_meta.dta`.

The variable `TB_case` has value 1 if an individual develops TB (is a case) and has value 0 if an individual does not develop TB.

The variable `Intervention` has value 1 if an individual was vaccinated against TB and is 0 otherwise.

The dataset also records `Year` of the studies and the `Latitude` at which each study was conducted. `Latitude` represents the variation in rainfall, humidity and environmental mycobacteria suspected of producing immunity against TB.

- 1) Analyze the data by study, taking `TB_case` as response and `Intervention` as exposure. Use Mantel-Haenszel within stratum weights.

To do this, use the following syntax:

- `es TB_Case Intervention [fweight = frequency], by(study)`

OR follow the steps below:

- **Statistics** → **Epidemiology and related** → **Tables for epidemiologists** → **Cohort study risk ratio (etc)**
- Specify `TB_case` as case variable and `Intervention` as exposed variable.
- Specify the variable `frequency` as weights, and under options stratify on `study` and select "Use Mantel-Haenszel".
- **Click Submit.**

You should get the table shown in Lecture 9.

- 2) Analyze the data accounting for the effects of latitude and year of study by fitting a logistic model with `TB_case` as response and `Intervention` as exposure.

## **Epm304 Advanced Statistical Methods In Epidemiology:**

**Modern Methods for Epidemiology** Yu-Kang Tu, Darren C. Greenwood, 2012-05-22 Routine applications of advanced statistical methods on real data have become possible in the last ten years because desktop computers have become much more powerful and cheaper. However, proper understanding of the challenging statistical theory behind those methods remains essential for correct application and interpretation and rarely seen in the medical literature. *Modern Methods for Epidemiology* provides a concise introduction to recent development in statistical methodologies for epidemiological and biomedical researchers. Many of these methods have become indispensable tools for researchers working in epidemiology and medicine but are rarely discussed in details by standard textbooks of biostatistics or epidemiology. Contributors of this book are experienced researchers and experts in their respective fields. This textbook provides a solid starting point for those who are new to epidemiology and for those looking for guidance in more modern statistical approaches to observational epidemiology. Epidemiological and biomedical researchers who wish to overcome the mathematical barrier of applying those methods to their research will find this book an accessible and helpful reference for self learning and research. This book is also a good source for teaching postgraduate students in medical statistics or epidemiology.

*Statistical Methods in Epidemiology* Harold A. Kahn, Christopher T. Sempos, 1989 This book is an expanded version of the Kahn's widely used text *An Introduction to Epidemiologic Methods* Oxford 1983. It provides clear insight into the basic statistical tools used in epidemiology and is written so that those without advanced statistical training can comprehend the ideas underlying the analytical techniques. The authors emphasize the extent to which similar results are obtained from different methods, both simple and complex. To this edition they have added a new chapter on Comparison of Numerical Results for Various Methods of Adjustment and also one on The Primacy of Data Collection. New topics include the Kaplan Meier product limit method and the Cox proportional hazards model for analysis of time related outcomes. An appendix of data from the Framingham Heart Study is used to illustrate the application of various analytical methods to an identical set of real data and provides source material for student exercises. The text has been updated throughout.

**Statistical Methods for Global Health and Epidemiology** Xinguang Chen, (Din) Ding-Geng Chen, 2020-04-13 This book examines statistical methods and models used in the fields of global health and epidemiology. It includes methods such as innovative probability sampling, data harmonization and encryption, and advanced descriptive, analytical and monitoring methods. Program codes using R are included as well as real data examples. Contemporary global health and epidemiology involves a myriad of medical and health challenges including inequality of treatment, the HIV/AIDS epidemic and its subsequent control, the flu, cancer, tobacco control, drug use and environmental pollution. In addition to its vast scales and telescopic perspective, addressing global health concerns often involves examining resource-limited populations with large geographic socioeconomic diversities. Therefore, advancing global health requires new epidemiological design, new data and new methods for sampling, data processing and statistical analysis.

This book provides global health researchers with methods that will enable access to and utilization of existing data. Featuring contributions from both epidemiological and biostatistical scholars, this book is a practical resource for researchers, practitioners, and students in solving global health problems in research, education, training, and consultation. **Statistical Analysis of Epidemiologic Data** S. Selvin, 1991. This text combines applied and theoretical approaches to the analysis of epidemiologic issues. It goes beyond elementary material to deal with real problems generated by disease data and delves into less usual areas such as the analysis of spatial distributions, survival data, proportional hazards regression, and computer-intensive approaches to statistical estimation. Each method discussed in the text is illustrated with examples which include complete sets of data. Using actual data demonstrates the strengths and weaknesses of different analytic approaches in describing a disease process. The book's goal is to develop a clear understanding of analytic approaches to problems in epidemiological data analysis without relying on sophisticated mathematics and advanced statistical theory. Individuals with some background in epidemiology and statistics will find this a useful volume in the study of epidemiological analysis.

**Handbook of Epidemiology** Wolfgang Ahrens, Iris Pigeot, 2025-04-15. Building on the success of the first and second editions, the updated third edition of the Handbook of Epidemiology serves as a major reference for all researchers who want to conduct epidemiological studies or who want to deepen their understanding of epidemiological concepts, methods, and areas of application. The new edition provides an update of all chapters of the second edition and includes additional new chapters to account for recent developments in the field. The book provides a comprehensive overview of the field and covers basic approaches as well as novel and advanced methodologies with a strong applied focus by integrating the most relevant state-of-the-art knowledge that otherwise could only be gathered from single specialist publications dispersed over various scientific journals. It reviews the key issues and methodological approaches pertinent to the field for which the reader pursues an expatiated overview. It may thus serve both as a first-orientation for the interested reader and as a starting point for an in-depth study of a specific area as well as a quick reference and a recapitulatory update for the expert. The broad scope of the book becomes apparent by its five sections that facilitate an integration of epidemiological concepts and methods, statistical tools, applications, and epidemiological practice. Part I covers Concepts and Designs in Epidemiology, Part II Methodological Approaches in Epidemiology, Part III Statistical Methods in Epidemiology, Part IV Exposure Oriented Epidemiology, and Part V Outcome Oriented Epidemiology. All chapters follow a similar structure and highlight cross-references to related topics and specialist knowledge to be found in the Handbook. They give an overview of the topic and the most important problems and approaches that are illustrated by examples. Each chapter serves as an introductory text that helps to enter a new field by addressing basic concepts without being too elementary. Thus, it also is of interest for readers who are familiar with the particular topic by reflecting on its state-of-the-art and future perspectives. Each chapter stands on its own and comprises introductory elements that can be understood by the novice, i.e., a readership not being too familiar.

with the methodological background and extends to in depth knowledge that may serve as a reference for the trained epidemiologist The standard procedures and methods basic concepts and knowledge are presented as well as recent advances and new perspectives The list of references thus covers the whole range from introductory texts to publications for the advanced reader In particular the chapters on statistical methods are written for researchers in health sciences who do not have the background of theoretical statisticians and may be in need of application oriented tools These chapters offer numerous examples practical applications and illustrations Handbook of Epidemiology 3rd Edition is a relevant resource for professionals involved in health research health reporting health promotion disease prevention health services and health systems administration as well as those who need a reference book that covers all aspects of epidemiology as a comprehensive consultant for specific topics The Handbook also is a useful text for researchers and graduate students in all disciplines related to epidemiology and public health
