

## Cornell Controlled Environment Agriculture

### Hydroponic Lettuce Handbook

This hydroponic greenhouse production system was designed for small operations to provide local production of head lettuce as well as employment to the proprietors. Our research group has experimented with many forms of hydroponics but have found this floating system to be the most robust and forgiving of the available systems. This system is built around consistent production 365 days of the year. This requires a high degree of environmental control including supplemental lighting and moveable shade to provide a target amount of light which, in turn, results in a predictable amount of daily growth.

desired traits in a short period These systems include genetic selection vertical hydroponics and data driven smart sensor applications Quick generation of plant varieties is achieved by manipulating photoperiods of a native plant with extended light periods in a controlled environment to fasten the crop cycle This allows for multiple plant generations to be grown and harvested in a single year rather than the typical one to two generations in traditional field based breeding The application of molecular markers in the analysis of crop genomes enables the identification and characterization of genetic variation within a crop species This in turn helps breeders in identifying and selecting plants with desirable traits such as resistance to pests or diseases or improved yield Marker assisted selection MAS and genomic selection GS are two recent methods that revolutionized plant breeding to improve the efficiency and accuracy of selecting desirable traits MAS allows breeders to identify desirable traits earlier in the breeding process without having to wait for the traits to be phenotypically expressed On the other hand GS allows breeders to predict the performance of a plant before it is even grown and can help speed up the breeding process by allowing breeders to select plants with desirable traits much earlier in the breeding process
