## The Theory of Group Schemes of Finite Type over a Field

J. S. MILNE

THE THEORY OF GROUP SCHEMES OF FINITE TYPE OVER A FIELD

J. S. MILNE

Algebraic groups play much the same role for algebraists as Lie groups play for analysts. This book is the first comprehensive introduction to the theory of algebraic group schemes over fields that includes the general theory of reductive algebraic groups and is written in the language of modern algebraic geometry.

The first eight chapters study general algebraic group schemes over a field and culminate in a proof of the Bruhat-Chevalley decomposition. Every algebraic group is an extension of an abelian variety by a reductive group. After a review of the Tits building philosophy, the author provides short accounts of Lie algebras and finite group schemes. The last chapters treat reductive algebraic groups over arbitrary fields, including the Bruhat-Chevalley structure theory. Indecomposable algebraic groups are studied in detail. Propositions have also been left to a minimum so that the book is accessible to non-specialists in algebraic geometry.

**(PMS-33)** J. S. Milne, 1980-04-21 One of the most important mathematical achievements of the past several decades has been A Grothendieck's work on algebraic geometry In the early 1960s he and M Artin introduced étale cohomology in order to extend the methods of sheaf theoretic cohomology from complex varieties to more general schemes This work found many applications not only in algebraic geometry but also in several different branches of number theory and in the representation theory of finite and  $p$  adic groups Yet until now the work has been available only in the original massive and difficult papers In order to provide an accessible introduction to étale cohomology J S Milne offers this more elementary account covering the essential features of the theory The author begins with a review of the basic properties of flat and étale morphisms and of the

algebraic fundamental group The next two chapters concern the basic theory of tale sheaves and elementary tale cohomology and are followed by an application of the cohomology to the study of the Brauer group After a detailed analysis of the cohomology of curves and surfaces Professor Milne proves the fundamental theorems in tale cohomology those of base change purity Poincar duality and the Lefschetz trace formula He then applies these theorems to show the rationality of some very general L series Originally published in 1980 The Princeton Legacy Library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905
