Abstract

The aim of the present study is to enumerate variations in terms of size, growth, morphology and biochemistry among South Indian *Artemia* populations namely Puthalam, Thamarakulam and Tuticorin. Cyst biometrics and hatching performances of the three *Artemia* populations were studied to enumerate the possible differentiation among them. A detailed post-embryonic development from cysts to adults, and morphological study with adults of two parthenogenetic (Puthalam, Thamarakulam) and one bisexual (Tuticorin) populations of the brine shrimp *Artemia* was performed. Multivariate Discriminant Analysis was carried out to separate and/or group together populations which exhibit great similarities. The quantitative estimation of the biochemical constituents such as protein, lipid and sugars, of the populations were studied following standard procedures. Biometrical and hatching characteristics revealed distinct variation among the three populations which could be taken as a tool to discriminate the populations. Post embryonic development was observed to complete by 13

stages in Tuticorin population, 17 stages in Puthalam population and Thamarakulam population, showing morphological and functional changes. Morphometric analysis showed that *Artemia* population from Tuticorin is morphologically divergent whilst the other two parthenogenetic populations partially overlap each other. The three populations of *Artemia* remain separated by the Discriminant Function, which has the total length, number of setae in a furca, eye diameter, head width and length of the furca as the morphological characteristics contributing most to the observed differences and contributing to the separation of parthenogenetic and the bisexual populations. Significant variations were observed in the relative concentrations of total proteins, total lipids, free cholesterol, glycoproteins and total free sugars among the populations with the Tuticorin population having higher concentration of all the biochemical constituents. This multi-trait approach for *Artemia* characterization is stressed as a way to obtain better descriptions and interpretations of the biological diversity in the genus.

Key Words: Biometry, post-embryonic development, morphometry, Discriminant Analysis, biochemical characterization

Biometrical Morphological And Biochemical:

Plant-Nematode Interactions and Their Management Strategies Mohd. Sayeed Akhtar, Khalid Rehman Hakeem, 2025-11-18 Nematodes are intriguing organisms that are members of the phylum Nematoda and are widespread around the world. These parasites can feed on a variety of decorative commercially important agricultural crops, reducing farmer income in both developed and developing nations. Although nematode disease and control strategies have been extensively studied in recent years, more research and investigation into the state of plant nematode interactions, management strategies, and damage control mechanisms needs to be done. This new volume provides in-depth knowledge of plant nematode interactions and delves into effective management techniques. First focusing on identification and characterization of plant parasitic nematodes using molecular techniques, the volume takes a deep look at their interactions with plants, focusing on agriculturally important crops as well as ornamental plants. It goes on to cover recent advances in disease control and management strategies of parasitic nematodes on plants and crops, focusing on biocontrol such as plant growth promoting rhizobacteria, PGPR, bioformulations, and other bioformulations.
