Abstract: The close formation flight of UAVs has many significant advantages over single vehicle flight. The aerodynamic stability analysis of two heterogeneous UAVs in close formation flight is detailed in the present paper. The issues of altitude changes and the associated shifts or changes in centre of gravity or moments, the equivalent actuator control surface deflections etc., are explained with the help of simulations. The short period frequency variations with these changes are also correlated with the help of pole-zero diagrams.

Keywords: Control, Close Formation Flight, Heterogeneous UAVs, Wing Vortex

1. Introduction

The Close Formation Flight (CFF) of Unmanned Aerospace Vehicles (UAVs) has diverse advantages such as fuel saving, cost reduction and preciseness in image capturing and data collection etc. The formation flight studies of heterogeneous Unmanned Aerial Vehicles (UAVs) in a stability analysis view point is hardly difficult to find. The proposed formation flight model in this paper consists of two members, namely 'leader' and 'follower'. The induced drag reduction caused by vortex effect of leader wing tips in close formation is made use of in this stability analysis work.

2. Literature Review

The most important control techniques used among available literature spanned over the last two decades are Intelligent Management Control Approach [1], Co-operative Control [2], Constraint Forces Approach [3], 3D Potential Field Approach [4], Co-operative tracking control [5], Constrained Adaptive Back-stepping Approach [6] and Vision based Scheme [7]. Proud, A. et al formulated PID feedback tracking control on two member system [8]. Dogan et al presented Linear Control Approach for formation reconfiguration [9]. Vanek and Balint applied Model

Predictive Control/oroncal-timetrjectory tracking of UAV formations [10]. Model Predictive Control Algorithm in non-linear dynamics is implemented by Saffarian and Fahimi [11]. The Decentralized Control Design Procedure for obstacle avoidance and collision is done by Haibo Min [12]. The aerodynamics associated with wing vortex effect and the resulting drag reduction is of special focus on the studies of P. Chichka et al. [13]. The simulation of aerodynamic cross-coupling vortex effects [14] is a useful reference for the present study.

After a brief review of relevant literature the stability analysis of two heterogeneous UAVs engaged in close formation flight and their associated aerodynamic interactions are detailed in section-III. The formation consensus of these UAVs from different altitude levels for drag reduction results in centre of gravity (c. g.) shifts and moment changes are quantitatively estimated and simulated in section-IV. These c. g. shifts and moment changes produces short period roots or frequency transitions, as illustrated by a pole-zero diagram at the end before conclusion. The aero stability analysis of the mechanical characteristics of two heterogeneous fixed-wing UAVs during a transformation to a close formation flight is highlighted in the present paper.

Analysis of Linked Aircraft Aerodynamics and Flight Dynamics Edgar Adrian Cuji, 2011

In this research I have analyzed different aircrafts with nonconventional wings The analyses have included aerodynamic modeling flight dynamics and trajectory optimization Two different nonconventional aircrafts are analyzed a V

shape morphing wings and a Linked UAV system A modern adaptation of Prandtl's liftingline method is utilized to analyze the aerodynamics of both systems This method can compute the aerodynamic forces for a system of lifting surfaces with arbitrary camber sweep dihedral position and orientation The V shape morphing wings consist of a wing configuration that has two panels an out of plane dihedral section and a horizontal section An analysis of the aircraft turning dynamics shows that by manipulating the dihedral angles of the V shape wings either by symmetric or asymmetric wing shape changes can affect the turning capabilities of an aircraft to perform a variety of different missions depending on the importance of each of the turning performance measurements A linked UAV concept where individual UAVs link at high altitude creates an aerodynamically efficient system of aircraft which has long endurance capabilities and can cruise for extended periods with significantly reduced power loads This dissertation presents an analysis of close proximity aerodynamics and aircraft dynamics of two Linked UAVs As the UAVs approach each other for wingtip docking there are strong aerodynamic coupling between their wings tips An aerodynamic disturbance intensity field has been generated utilizing both simulation and wind tunnel data to determine a trajectory for the two UAVs to approach each other for midair docking Finally two optimal trajectories a 2 D and 3 D docking trajectories are generated and compared Dynamic wind tunnel test are performed to compare different midair wingtip docking trajectories The results of the optimization concludes that a trajectory with a span wise approach is more desirable since it goes through the least aerodynamic disturbances and requires less control effort to perform the midair docking maneuver

Aerodynamic Characteristics and Longitudinal Stability of Tube Launched Tandem-Scheme UAV Illia S. Kryvokhatko,2018 Tube launched unmanned aerial vehicles UAV are often implemented with aerodynamic scheme with forward and rear wings so called tandem scheme Specificity of such UAV is that immediately after launch they have a flight path in which wings are turned from position along the fuselage to flight position in which sweep angles are about zero UAV aerodynamic characteristics for different wing rotation angles were researched by computational fluid dynamics CFD methods Ansys 16 software Quantitative results prove that UAV is unstable with wings rotation angles up to 60 because rear wings produce lift ahead of center of gravity Therefore low time of wings unfolding is required For high angles of wings rotation low sweep angles UAV model is stable in a wide range of angles of attack Local aerodynamic defects were found in the area of the rotation units of both wings Longitudinal vortex along the left side of fuselage was observed but it does not result in significant roll moment Further research might include UAV dynamics modelling based on calculated aerodynamics characteristics or flight tests

Bergen Industrial UAV was modeled for computer simulation to analyze its inherent stability and control characteristics. The NPS designed JANRAD software was utilized to determine the stability and control derivatives used in the simulation model. The identification of the UAV dynamic model will aid in the development of closed loop controllers capable of autonomous UAV control. The fidelity of the simulation model was verified by comparing the simulation responses with data collected from on board sensors during test flight.

Robust Aeroservoelastic Stability Analysis Rick Lind, Marty Brenner, 2012-12-06

The series *Advances in Industrial Control* aims to report and encourage technology transfer in control engineering. The rapid development of control technology impacts all areas of the control discipline: new theory, new controllers, actuators, sensors, new industrial processes, computer methods, new applications, new philosophies, new challenges. Much of this development work resides in industrial reports, feasibility study papers, and the reports of advanced collaborative projects. The series offers an opportunity for researchers to present an extended exposition of such new work in all aspects of industrial control for wider and rapid dissemination. The high performance control systems applications in aerospace and astronautics almost have a tradition of exploiting the most advanced control theoretical developments first. The optimal control and filtering paradigm associated with the names of Kalman, Bucy, Anderson, and Moore found application in the astronautics of the 1960s and 1970s. At the beginning of the 1980s, control theory moved on to robustness, singular values, and μ analysis. This new work was associated with the names of Zames, Doyle, Glover, Balas, among others. The *Advances in Industrial Control* monograph series have published several volumes over the years which have archived the applications experience garnered from applying robust control to the aerospace sector problems. Rick Lind and Marty Brenner add to this set with their volume on robust aeroservoelastic stability. This volume reports the application of the structured singular value to aeroelastic and aeroservoelastic aerospace problems.
