VLSI Physical Design: From Graph Partitioning to Timing Closure Andrew B. Kahng, Jens Lienig, Igor L. Markov, Jin Hu, 2011-01-27 Design and optimization of integrated circuits are essential to the creation of new semiconductor chips and physical optimizations are becoming more prominent as a result of semiconductor scaling Modern chip design has become so complex that it is largely performed by specialized software which is frequently updated to address advances in semiconductor technologies and increased problem complexities A user of such software needs a high level understanding of the underlying mathematical models and algorithms On the other hand a developer of such software must have a keen understanding of computer science aspects including algorithmic performance bottlenecks and how various algorithms operate and interact VLSI Physical Design From Graph Partitioning to Timing Closure introduces and compares algorithms that are used during the physical design phase of integrated circuit design wherein a geometric chip layout is produced starting from an abstract circuit design The emphasis is on essential and fundamental techniques ranging from hypergraph partitioning and circuit placement to timing closure

Embedded Systems and Software Validation Abhik Roychoudhury, 2009-04-29 Modern embedded systems require high performance low cost and low power consumption Such systems typically consist of a heterogeneous collection of processors specialized memory subsystems and partially programmable or fixed function components This heterogeneity coupled with issues such as hardware software partitioning mapping scheduling etc leads to a large number of design possibilities making performance debugging and validation of such systems a difficult problem Embedded systems are used to control safety critical applications such as flight control automotive electronics and healthcare monitoring Clearly developing reliable software systems for such applications is of utmost importance This book describes a host of debugging and verification methods which can help to achieve this goal Covers the major abstraction levels of embedded systems design starting from software analysis and micro architectural modeling to modeling of resource sharing and communication at the system level Integrates formal techniques of validation for hardware software with debugging and validation of embedded system design flows Includes practical case studies to answer the questions does a design meet its requirements if not then which parts of the system are responsible for the violation and once they are identified then how should the design be suitably modified
