China **Organic Thin Film Transistor Integration** Flora Li, Arokia Nathan, Yiliang Wu, Beng S. Ong, 2011-03-21 Research on organic electronics or plastic electronics is driven by the need to create systems that are lightweight unbreakable and mechanically flexible With the remarkable improvement in the performance of organic semiconductor materials during the past few decades organic electronics appeal to innovative practical and broad impact applications requiring large area coverage mechanical flexibility low temperature processing and low cost Thus organic electronics appeal to a broad range of electronic devices and products including transistors diodes sensors solar cells lighting displays and electronic identification and tracking devices A number of commercial opportunities have been identified for organic thin film transistors OTFTs ranging from flexible displays electronic paper radio frequency identification RFID tags smart cards to low cost disposable electronic products and more are continually being invented as the technology matures The potential applications for plastic electronics are huge but several technological hurdles must be overcome In many of these applications transistor serves as a fundamental building block to implement the necessary electronic functionality Hence research in organic thin film transistors OTFTs or organic field effect transistors OFETs is eminently pertinent to the development and realization of organic electronics This book presents a comprehensive investigation of the production and application of a variety of polymer based transistor devices and circuits It begins with a detailed overview of Organic Thin Film Transistors OTFTs and discusses the various possible fabrication methods reported so far This is followed by two major sections on the choice optimization and implementation of the gate dielectric material to be used Details of the effects of processing on the efficiency of the contacts are then provided The book concludes with a chapter on the integration of such devices to produce a variety of OTFT based circuits and systems The key objective is to examine strategies to exploit existing materials and techniques to advance OTFT technology in device performance device manufacture and device integration Finally the collective knowledge from these investigations facilitates the integration of OTFTs into organic circuits which is expected to contribute to the development of new generation of all organic displays for communication devices and other pertinent applications Overall a major outcome of this work is that it provides an economical means for organic transistor and circuit integration by enabling the use of a well established PECVD infrastructure while not compromising the performance of electronics The techniques established here are not limited to use in OTFTs only the organic semiconductor and SiNx combination can be used in other device structures e g sensors diodes photovoltaics Furthermore the approach and strategy used for interface optimization can be extended to the development of other materials systems
