## Revision Notes for Class 11 Biology

### Chapter 1 – The Living World

Life is a unique process that is made from the aggregation of molecules. These molecules undergo various chemical reactions to perform their specific functions which are called metabolism. This results in the production and utilization of energy. The metabolism will result in the growth, development, reproduction, adaptations, etc of living organisms through the production of various biomolecules.

All the living organisms that live in various habitats are found to share a somewhat similar genetic material that may be either terrestrial, or aquatic, in mountains, deserts, oceans, forests, etc.

Living organisms contain certain important characteristics that include growth and development, body organization, homeostasis, reproduction, adaptation, and energy utilization.

#### **Diversity in the Living World:**

The Earth is the main area where living organisms live. The world consists of millions of living organisms that sometimes we cannot even see with our naked eyes. These organisms are found to be living in various habitats that include forests, oceans, deserts, lakes, mountains, and even hot water springs.

There are different types of plants, animals, and insects in the world. This is very important and their variability is necessary for survival. The number of species identified and studied is 1.7-1.8 million. They all together make a natural diversity of life in the world which is generally called biological diversity or biodiversity.
