Electricity Revision

Static Electricity

- When you rub two different insulating materials against each other they become electrically charged. This only works for insulating materials. Electrical charges are unable to pass through conductors such as wires.
- When the materials are pulled apart they separate:
 - Negatively charged particles (called electrons) move from one material to the other.
 - The material that loses electrons becomes positively charged.
 - The material that gains electrons becomes negatively charged.
 - Both materials gain an equal amount of charge, but the charges are opposite.

Resistance

- For electric current flow, when electrons move through a conductor, such as a metal wire, the moving electrons can collide with the ions in the metal. This makes it more difficult for the current to flow and creates resistance.
- The resistance of a long wire is greater than the resistance of a short wire because electrons collide with ions more often.
- The resistance of a thin wire is greater than the resistance of a thick wire because a thin wire has fewer electrons to carry the current.

Calculating power

- You can work out power using this equation: $P = I \times V$
- P is the power in watts, W
- I is the current in amperes (amps), A
- V is the voltage in volts (the work done in Joules, J)

Calculating current

- The size of an electric current is the rate of flow of electric charge. You can calculate the size of a current using this equation: $I = \frac{Q}{t}$
- I is the current in amperes (amps), A
- Q is the charge in coulombs, C
- t is the time in seconds, s

Measuring resistance

- The resistance shows the relationship between potential difference, current and resistance: $R = \frac{V}{I}$
- R is the resistance in ohms, Ω
- V is the potential difference in volts, V
- I is the current in amperes (amps), A

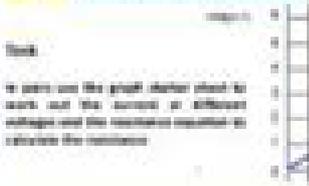

Calculating potential difference

- The potential difference between two points in an electric circuit is the work done when a coulomb of charge passes between the points. You can calculate the size of a potential difference using this equation: $V = W \div Q$
- V is the potential difference in volts, V
- W is the work done in joules, J
- Q is the charge in coulombs, C

Introduction
The current flowing through a circuit is directly proportional to the voltage. Double the voltage, the current also doubles. The graph shows what happens. (Remember Ohm's Law)

Calculating Resistance

Task:
Use the equation below to complete your table calculating the resistance for each set of variables.

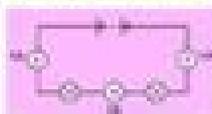

$$\text{resistance} = \frac{\text{voltage}}{\text{current}}$$

$$R = \frac{V}{I}$$

| Voltage (V) | Current (amp) | Resistance (ohm) |
|-------------|---------------|------------------|
| 10 | 1 | |
| 15 | 3 | |
| 20 | 5 | |
| 25 | 10 | |

Series Circuits

Current stays the same

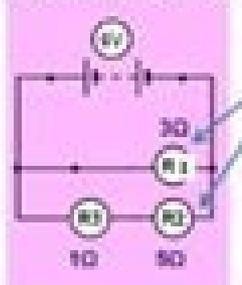

Voltage is split

Calculating resistance

- Resistance = current/voltage
- Work out the resistance for:

Parallel Circuits

Calculating Current

- Current = Voltage / Resistance
- $5 / 1 = 5A$
- $5 / 2 = 2.5A$
- Total = $5 + 2.5 = 7.5A$
