

# Advanced PID Controller Implementation

In this digital era, PID controllers have evolved from basic textbook structure to more sophisticated algorithms. Features such as setpoint/derivative weightings and anti-windup scheme are often added to improve the closed-loop response. In our previous article *A Decorated PID Controller*, we consider a PID structure with modification and additional functions as follows

- To lessen the effect of measurement noise, derivative part is implemented as a filter with parameter
- Back calculation anti-windup scheme is implemented with tracking gain
- Setpoint weightings for proportional and derivative paths can be adjusted via and , respectively

A feedback diagram with this advanced PID controller is constructed using Xcos palettes as in Figure 1.

**Advances in PID Control** Valery D. Yurkevich,2011-09-06 Since the foundation and up to the current state of the art in  
control engineering the problems of PID control steadily attract great attention of numerous researchers and remain  
inexhaustible source of new ideas for process of control system design and industrial applications PID control effectiveness is  
usually caused by the nature of dynamical processes conditioned that the majority of the industrial dynamical processes are  
well described by simple dynamic model of the first or second order The efficacy of PID controllers vastly falls in case of  
complicated dynamics nonlinearities and varying parameters of the plant This gives a pulse to further researches in the field  
of PID control Consequently the problems of advanced PID control system design methodologies rules of adaptive PID control  
self tuning procedures and particularly robustness and transient performance for nonlinear systems still remain as the areas  
of the lively interests for many scientists and researchers at the present time The recent research results presented in this  
book provide new ideas for improved performance of PID control applications Advanced Research on Intelligent System,
