Constructive Methods in Computing Science Manfred Broy,2012-12-06 Computing Science is a science of constructive methods The solution of a problem has to be described formally by constructive techniques if it is to be evaluated on a computer The Marktoberdorf Advanced Study Institute 1988 presented a comprehensive survey of the recent research in constructive methods in Computing Science Some approaches to a methodological framework and to supporting tools for specification development and verification of software systems were discussed in detail Other lectures dealt with the relevance of the foundations of logic for questions of program construction and with new programming paradigms and formalisms which have proven to be useful for a constructive approach to software development The construction specification design and verification especially of distributed and communicating systems was discussed in a number of complementary lectures Examples for those approaches were given on several levels such as semaphores nondeterministic state transition systems with fairness assumptions decomposition of specifications for concurrent systems in liveness and safety properties and functional specifications of distributed systems Construction methods in programming that were presented range from type theory the theory of evidence theorem provers for proving properties of functional programs to category theory as an abstract and general concept for the description of programming paradigms

Gavrilova,Vipin Kumar,Youngsong Mun,C.J. Kenneth Tan,Osvaldo Gervasi,2004-05-07 The natural mission of Computational Science is to tackle all sorts of human problems and to work out intelligent automata aimed at alleviating the burden of working out suitable tools for solving complex problems For this reason ComputationalScience thoughoriginatingfromtheneedtosolvethemostchallenging problems in science and engineering computational science is the key player in the fight to gain fundamental advances in astronomy biology chemistry environmental science physics and several

other scientific and engineering disciplines is increasingly turning its attention to all fields of human activity. In all activities in fact intensive computation, information handling, knowledge synthesis, the use of ad hoc devices etc increasingly need to be exploited and coordinated regardless of the location of both the users and the various and heterogeneous computing platforms. As a result the key to understanding the explosive growth of this discipline lies in two adjectives that more and more appropriately refer to Computational Science and its applications: interoperable and ubiquitous. Numerous examples of ubiquitous and interoperable tools and applications are given in the present four LNCS volumes containing the contributions delivered at the 2004 International Conference on Computational Science and its Applications ICCSA 2004 held in Assisi Italy May 14-17 2004.
