**Service Parts Management** Nezhil Altay, Lewis A. Litteral, 2011-03-24 With the pressure of time based competition increasing and customers demanding faster service availability of service parts becomes a critical component of manufacturing and servicing operations Service Parts

Management first focuses on intermittent demand forecasting and then on the management of service parts inventories. It guides researchers and practitioners in finding better management solutions to their problems and is both an excellent reference for key concepts and a leading resource for further research. Demand forecasting techniques are presented for parametric and nonparametric approaches and multi echelon cases and inventory pooling are also considered. Inventory control is examined in the continuous and periodic review cases while the following are all examined in the context of forecasting error measures, distributional assumptions and decision trees. Service Parts Management provides the reader with an overview and a detailed treatment of the current state of the research available on the forecasting and inventory management of items with intermittent demand. It is a comprehensive review of service parts management and provides a starting point for researchers, postgraduate students and anyone interested in forecasting or managing inventory.

**Intermittent Demand Forecasting for Inventory Control** Ngan Ngoc Chau, 2020. Managing intermittent demand is a challenging operation in many industries since this type of demand is difficult to forecast. This challenge makes it hard to estimate inventory levels and thus affects service levels. The purpose of this study is to examine the impact of multiple levels of data aggregation on forecasting intermittent demand and subsequently on inventory control performance. In particular we propose a procedure that integrates lead time and customer heterogeneity into the forecasting using temporal and cross sectional aggregation. Using data from a real world setting and simulation our analysis revealed that when high service levels were important for the company operations the forecasting approach using temporal aggregation that incorporates lead time information yielded a higher level of inventory efficiency in terms of both the holding cost and the realized service level. It appeared that when forecasts using temporal aggregation were augmented with information about customer behavior their purchase patterns might be a helpful consideration for enhancing inventory performance. These findings allow us to provide useful recommendations for improving the current forecasting procedure and inventory control to the sponsor company of this project.
