Aylor,Barry W. Johnson,Wm.A. Wulf,2012-12-06 Current practice dictates the separation of the hardware and software development paths early in the design cycle These paths remain independent with very little interaction occurring between them until system integration In particular hardware is often specified without fully appreciating the computational requirements of the software Also software development does not influence hardware development and does not track changes made during the hardware design phase Thus the ability to explore hardware software tradeoffs is restricted such as the movement of functionality from the software domain to the hardware domain and vice versa or the modification of the hardware software interface As a result problems that are encountered during system integration may require modification of the software and or hardware resulting in potentially significant cost increases and schedule overruns To address the problems described above a cooperative design approach one that utilizes a unified view of hardware and

software is described This approach is called hardware software codesign The Codesign of Embedded Systems develops several fundamental hardware software codesign concepts and a methodology that supports them A unified representation referred to as a decomposition graph is presented which can be used to describe hardware or software using either functional abstractions or data abstractions Using a unified representation based on functional abstractions an abstract hardware software model has been implemented in a common simulation environment called ADEPT Advanced Design Environment Prototyping Tool This model permits early hardware software evaluation and tradeoff exploration Techniques have been developed which support the identification of software bottlenecks and the evaluation of design alternatives with respect to multiple metrics The application of the model is demonstrated on severalexamples A unified representation based on data abstractions is also explored This work leads to investigations regarding the application of object oriented techniques to hardware design The Codesign of Embedded Systems A Unified Hardware Software Representation describes a novel approach to a topic of immense importance to CAD researchers and designers alike *Dependable Embedded Systems* Jörg Henkel,Nikil Dutt,2020-12-09 This Open Access book introduces readers to many new techniques for enhancing and optimizing reliability in embedded systems which have emerged particularly within the last five years This book introduces the most prominent reliability concerns from today s points of view and roughly recapitulates the progress in the community so far Unlike other books that focus on a single abstraction level such circuit level or system level alone the focus of this book is to deal with the different reliability challenges across different levels starting from the physical level all the way to the system level cross layer approaches The book aims at demonstrating how new hardware software co design solution can be proposed to ef fectively mitigate reliability degradation such as transistor aging processor variation temperature effects soft errors etc Provides readers with latest insights into novel cross layer methods and models with respect to dependability of embedded systems Describes cross layer approaches that can leverage reliability through techniques that are pro actively designed with respect to techniques at other layers Explains run time adaptation and concepts means of self organization in order to achieve error resiliency in complex future many core systems **Embedded Systems Design using the MSP430FR2355 LaunchPadTM** Brock J.
