Unmanned Aircraft Design Mohammad H. Sadraey, 2024-09-07
This book provides fundamental principles design procedures and design tools for unmanned aerial vehicles UAVs with three sections focusing on vehicle design autopilot design and ground system design
The design of manned aircraft and the design of UAVs have some similarities and some differences
They include the design process constraints e g g load pressurization and UAV main components autopilot ground station communications system sensors and payload
A UAV designer must be aware of the latest UAV developments current technologies know lessons learned from past failures and they should appreciate the breadth of UAV design options
The contribution of unmanned aircraft continues to expand every day and over 67 countries are developing and employing UAVs for both military and civil scientific purposes
A UAV system is much more than a reusable air vehicle or vehicles
UAVs are air vehicles they fly like airplanes and operate in an airplane environment
They are designed like air vehicles they have to meet critical air vehicle requirements
A designer needs to know how to integrate complex multi disciplinary systems and to understand the environment the requirements and the design challenges and this book is an excellent overview of the fundamentals from an engineering perspective
This book is meant to meet the needs of newcomers into the world of UAVs
The materials are intended to provide enough information in each area and illustrate how they all play together to support the design of a complete UAV
Therefore this book can be used both as a reference for engineers entering the field or as a supplementary text for a UAV design course to provide system level context for each specialized topic
The second edition is extensively revised
Some of the new terminologies concepts and specific unmanned aircraft systems are introduced
The revisions make the book clearer and easier to understand and will add number of new

subjects in areas that have become more prominent in the unmanned aviation world Fundamentals of Modeling and Analyzing Engineering Systems Philip D. Cha, James J. Rosenberg, Clive L. Dym, 2000-04-13 System modeling and analysis is a standard activity in every engineering discipline This text offers a broad based introduction to engineering systems incorporating material from mechanical electrical aerospace and chemical engineering The overall theme that distinguishes the text from others is its unified treatment of disparate physical systems emphasizing similarities in both the modeling and behaviour of lumped element systems Linear graph theory provides the framework for modeling engineering systems as lumped elements The analysis of system dynamics that follows is organized by behavioral characteristics rather than by engineering subdisciplines Next the Laplace transform is introduced as a tool for understanding frequency response The final chapter covers feedback systems Every chapter includes a wide variety of examples as well as exercise problems drawn from real world mechanical electrical hydraulic chemical and thermal systems Aimed at second and third year undergraduates this introductory text offers a unified entry to the multidisciplinary world of engineering
