

## Steam Turbines-Generators and Auxiliary Systems - Program 65

### Program Overview

#### Program Description

Because up to 70% of outages planned for steam power plants involve work on the turbine, power producers continually seek ways to optimize operation and maintenance activities on aging turbine-generator fleets. Such activities can reduce maintenance costs, improve component reliability, and increase generator output. Maintaining a detailed awareness of effective maintenance techniques, however, is challenged by evolving operating experience, advanced materials and upgrade options, reduced staffing levels, and the retirement of experienced personnel.

The Electric Power Research Institute's (EPRI's) Steam Turbines-Generators and Auxiliary Systems program (Program 65) develops technologies and guidelines that help plant operators optimize steam turbine and generator equipment life cycles to increase availability, shorten scheduled maintenance outages, and improve steam turbine performance. Research and technical support activities enable power plants to reduce operation and maintenance costs, maximize plant performance, and more effectively implement plant upgrades and asset management strategies.

Program 65 has been fully integrated with the EPRI Nuclear Steam Turbine Initiative (NSTI) since 2000. This leveraging has increased the value of each program to its respective members, as well as provided the benefit of increased information exchange between Fossil and Nuclear sectors in areas of common interest. In 2010, the combined R&D from both fossil and nuclear units will continue, but now it will be made available to members of both sectors under Program 65. Past NSTI members can continue their involvement in EPRI's T-G R&D through membership in Program 65.

#### Research Value

Using an integrated approach that incorporates work from related EPRI programs, this program focuses on reducing operations and maintenance (O&M) costs, managing risk, maximizing plant performance, providing technical support for plant staff, and producing information to support upgrade studies and asset management strategies. Research results inform utility decisions regarding run/repair/replace and provide detailed guidance for planning and performing critical overhaul and maintenance activities.

- By participating in this program, plant operators can:
  - reduce maintenance costs
  - lower operating and regulatory risks
  - implement cost-effective thermal performance improvements
  - extend component life
  - increase staff technical expertise
- Involvement in the program will:
  - educate participants about worldwide turbine-generator (T-G) issues and solutions
  - provide opportunities to share information with industry experts, utility engineers, major T-G original equipment manufacturers (OEMs), and vendor/service providers worldwide

#### Approach

The program portfolio includes generating guidelines; analyses of the effects of flexible operation and unit upgrades and updates; preventive maintenance (PM) guides; guidance on maintenance and repair optimization; risk assessment and advanced modeling technologies; performance assessment tools; and information exchanges, including reports, workshops and users groups.
